From: Jim Johnson
Topic: 1657 Message: 1668

I think we have a misunderstanding here. When I talked about using the Rino with APRS I was only referring to its GPS functionality - not its transceiver functionality. It is used "with" APRS the same way any GPS receiver is used "with" APRS. It is merely supplying GPS data to a radio via a TNC. I assumed (perhaps incorrectly) that that was intent of the original poster of this thread.

Jim

Subject: [APRS] Re: Garmin Rino and APRS

Jim, I don't understand how you use the Rino "with" APRS. If you're using the Rino as a dumb GPS...I don't call that using it with APRS. If you're using the Rino "with" APRS in the full sense of the word, sending APRS tones over the radios with TNCs and making the Rino an integral part of things...that's the part where I don't know if that's a legal use or not.

Or are you using a network of Rino's and then using one of them as a gateway to send all the information into an APRS system? Give us all a hint, my telepathy is getting jammed today.<G>

Jerry, Versions 4.0 thru 9.0 are the only versions of DeLorme Street Atlas that will work with APRS+SA, the Road Warrior and Road Atlas 2000 and newer versions will not. Try e-bay for older versions of SA.

I'll have to look, but I might have a copy of Version 8.0 at the house... Can't remember if I took it to Dayton last year to sell or not... I saved 9.0 when DeLorme started the new series...

If the file format for Ver 9 was able to be reverse engineered for
APRS+SA to be able to read them, perhaps the format for the
new version could be decoded. Then maybe a conversion
program from new to old could be written.

The last major program I wrote was in assembly code for
an embedded Z80 over 10 years ago and have been hardware
hacking since... so I'm not the person to do this.

I know Kenwood has the new APRS enabled Dual bander, but what other mobiles are out there that will allow normal 2 meter use and will switch over to APRS use when required by either an external or internal TNC? Basically, no room in vehicle for 2 radios.

The only other radio in existance other than the two kenwoods with direct APRS capanility is the Alinco DR-620 T/E and it requires an add on board to do it:

I use a D700 and a digitraveler in my car. When properly connected to the D700 it wakes up on radio power up and goes to sleep when the radio is turned off. (both are hooked to constant power) There is a modification that people do to "force" the digitraveler to wake, but it is NOT needed with a D700. (I have 2 Digis.... one modified and one not. both work)

Hi Doug!

Really the D-700 is the only way to go for mobile. It was designed and BUILT to do APRS. The Alinco's weren't from what I understand. The D700 has APRS integrated into it so well it is totally seamless and very easy to use. Most people that I know that have them leave APRS running on one side and use the other for regular transmitting and monitoring. The D700 also monitors several other bands outside the ham bands easily.

I have read other comments about the Alincos for APRS. I think if you really compared the two, you would see the real value in the D700. By the way, its not NEW. The D700 has been around for at least 3 or 4 years that I know of, maybe longer.

In case you couldn't tell, I have one and love it!

--- In APRS@yahoogroups.com, "Martin Maxwell" <maxwell679@c...> wMy undertsanding is that the Alinco radio is essentially a dumb tracker, whereas the TM0D700A is is a "full functioned" smart APRS radio. The Alimco reportedly cannot receive/display APRS messages but the Kenwood can. The Kenwood also has a full TNC.

1682. Dummies Guide to Kenwood TM-D700A to Digitraveler Hook-Up

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-15 21:13:18 UTC
From: obrienaj
Topic: 1682 Message: 1682

Kenwood TM-D700A to Digitraveler Hook-Up :

Here is an explanation of how to easily connect your Kenwood TM-D700A radio to the Radio Shack Digitraveler GPS Unit (PDA version). These GPS devices have been discontinued by Radio Shack but if in stock they are selling for $29.97, a very cheap way to get into APRS with GPS.

There are several links on the Internet that explain how to connect the Digitrveler and the TM-D700A, , the ones I read were frequently overly complicated, or left out important information. This is the easy, "dummies guide"

Kenwood TM-D700A Radio Set-Up

First, you will need to set up your Kenwood TM-D700A to allow APRS capability. The essential items are:

Make sure "TNC-APRS" is indicated on your Kenwood TM-D700A display. (If not , use your manual to learn how to enable this feature).

Make sure that "Bcon" is indicated on your Kenwood TM-D700A display. (If not , use your manual to learn how to enable this feature).

Make sure that "GPS" is indicated on your Kenwood TM-D700A display. (If not , use your manual to learn how to enable this feature). Also, make sure your GPS settings in the Kenwood TM-D700A's sub-menu are set at "NMEA" . The Kenwood manual explains how to do this.

Make Sure that "1200" (packet baud rate) is indicated on your Kenwood TM-D700A display. (If not , use your manual to learn how to enable this feature). 1200 is the default baud rate for the radio, so this should already be set.

Connecting the Kenwood TM-D700A to the Digitraveler GPS Device.

Cut the PDA connector off one of the cables supplied with the Digitraveler (the PDA version of the Digitraveler comes with THREE connector cables, so you can make three cables if you want!) This will leave you with a cable that has a RJ-45 connector at one end, and three bare wires at the other end. You will have a Red wire, a Black wire, and a Brown wire.

Next, locate the cable that is supplied with the Kenwood TM-D700A. This is a long thin cable with a sub-miniature plug on one end , and three bare wires on the other end. The Kenwood supplied cable has wires that are white, red (may look orange to some eyes), and

bare wire .

I tried temporary connections of the above three wires to the GPS wires and twisted them together. This was a major mistake since the wires of the Kenwood radio are so thin and contain non-conducting fibers within the copper strands. The result was that I was not making a good electrical connection between the Kenwood and Digitraveler cables.

So, to avoid the above ... first "tin" thoroughly, the Red, White, and ground wires on the Kenwood cable. Double check for good continuity by taking a multi-meter and connecting the probes to the bare ends of the Kenwood wires. Check a few places along the length of the bare wires that you stripped back.

Now, connect the supplied Kenwood TM-D700A cable to the Digitraveler cable. as follows:

Red wire on the Kenwood to the Brown wire of the Digitraveler
White wire on the Kenwood to the Red wire of the Digitraveler
Bare ground wire on Kenwood cable to the Black wire of the Digitraveler.

That's it! At least as far as the connection goes.

Getting power to the Digitraveler:

The next step is getting power to the Digitraveler. You can simply insert 3 AAA batteries in the Digitraveler or an alternative 6 volt DC supply. Since I use mine in the car, I purchased a cigarette lighter device that drops the car's 12 volts down to 6 volts. I got mine from Radio Shack , it included a free coaxial power connector. I selected the "Type B" connector which fits the Digitraveler.

You should take the cable you made up, plug in the RJ-45 connector in to the Digitraveler and the sub-miniature plug in to the back of you Kenwood TM-D700A in the jack marked GPS.

With your radio on and power connected to the Digitraveler, you should see the Green LED on your Digitraveler light up. If it does not, re-check the connections you made on the cable and double check you have power supplied to the Digitraveler. If the green light is on, you're all set. The Digitraveler will need a few minutes to "lock-on" to the GPS satellites. My experience has been that it can take 2-3 minutes on the first occasion, sometimes longer if it is a very cloudy day. Make sure your Digitraveler is in a position that allows it to easily see the GPS satellites. It generally does not work inside your home or office. If outside make sure that there are no trees above your vehicle.

Within a couple of minutes, you should notice the "GPS" display on your Kenwood TM-D700A begin to flash. If it flashes, Eureka ! That's it.

You can press the Function button on your Kenwood, hold it down long enough (two beeps) to see the APRS menu. Select "position" and your Kenwood will display you Longitude/Latitude, altitude, and a few other things. The GPS unit will update you Kenwood's clock from the satellite with UTC time. See you Kenwood TM-D700A manual for instructions on how to set you own particular UTC/GMT off-set.

There, that was easy, right?

Enjoy.

There are a bunch on Ebay now if you search on digitraveler.
If you are looking for inexpensive - that is the one. It is
sometimes slow to get lock but it can do the job.

From: Peter May
Topic: 1687 Message: 1687

Hi all.

This next question is related to 2 private networks and not the aprs networks. Just thought I would point this out before everyone tells me I cannot do this...

I need to route AX25 packets between 2 radio networks. That is what is received on one is buffered until the second radio network is free and then transmitted on it and vice versa. I need a PIC related solution as it is located remotely with no computer. Does anyone know of any kits etc to do this?

Regards, Peter

1688. TM-D700/TH-D7's with Digitravelers, why?

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-16 14:47:08 UTC
From: aprswatcher
Topic: 1688 Message: 1688

Greetings All,
Have seen lots of messages this week of OM wanting to hook up the Kenwood TM-D700 mobiles & the TH-D7A(G) ht radios to the RS Digitraveler GPS units. This turns good radios into "Dumb Tracker" ie you only beacon out your position at a preset intreval, you CANNOT see the icon's of the other APRS Stations in your area, yes you will get a position information on them displayed on the D700/D7A.

One of the great features of using a D700/D7A with a GPS that has an LCD display is you can see the other APRS stations icon's, objects of say "severe thunderstorms" or "wildland fires", etc.. These are displayed right on the gps's LCD screen, you can see how close/far they are, in what direction they are to your position, etc.

One of the greatest joys of mobile APRS I get is when I see another D700/D7A or mobile APRS station coming down the road in the opposite direction, this usually allows you to call them on simplex, and have a chat.

True a GPS unit with an LCD display is more money than a RS Digitraveler, but your D700/D7A will be alot more useful.

Use the Digitravlers with computers or with the Tiny Traks.

I have a D700 that I use with either a Garmin GPSIII+ or a Garmin GPSMAP 176.

I also have 2 Tiny Trak III's, one uses the RS Digitraveler and one uses a DeLuo gps receiver.

Hope this helps, and I don't get flamed.
73, Rex.

Not a flame. Just clarifying something. Not ALL display screen GPS units will show other stations. I use a Magellan SporTrak Map GPS which will not show the positions of other stations. Not of the Magellans will. The Garmins which Rex mentioned will and, while I like the Magellan, if you want to see other statons on your GPS follow Rexs advice and go with the Garmin.
For station location mapping I use an old laptop with UI-View which is plugged into my D700.
Maybe sometime in the future Garmin wil get off their butts and build a Ham version of the Rino. Until then,
Happy Hamming,
Steve, KC5SAS

Maybe...

The D700 is not a "dumb tracker" , it does display who it is hearing, will give a bearing/heading, and indicate the station icon, all on the D700 display. You can also receive weather alerts via the D700.

With the Radio Shack Digitraveler, you can hook it up to a laptop and, using UI-View and Precision Maps, get a MUCH better display than any GPS with display unit under $1000.

My old Magellan 3000 and 4000 both show the other stations. I can't see why the gps would affect receiving other station positions. That data should be coming directly to the radio and then the tnc. You can receive other stations without a tnc.

Whoops. I meant to say. You can receive other stations positions without a gps. The gps only feeds the nmea data to your tnc.

Here is the answer I received when I asked the same question on the TH-D7A reflector. It was the 3rd item I didn't have set correctly.

Dick - W6CCD

First you must check your cable has three wires (input, output and ground) to and from the GPS Receiver.

Then you must select on Setup, Interface, NMEA In/NMEA Out, 4800 Baud.

Then you must go to APRS Menu on your TH-D7A and set: WAYPOINT: 9digits NMEA.

1708. Viewing an APRS Track

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-23 11:56:00 UTC
From: wbickle
Topic: 1708 Message: 1708

Is there a website out there that allows one to view an actual track (say the last 24 hours of transmitted positions), rather than simply the latest one?

Seems to me I've seen such a site, but now that I need it, I can't find it.

Many thanks,

Bill W2ET-5

1720. Re: HT suggestions

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-31 13:37:10 UTC
From: Beischel
Topic: 1718 Message: 1720

Dave,

I have both the VX7R and the TH-D7A. Both are nice radios. However, for APRS, the Kenwood D7A is the only way to go. For APRS all you need is the D7A and a GPS unit. Fewer boxes and cables make this a really easy, portable system.

Good Luck on your test.

1721. KPC-3+ and Delorme's Earthmate GPS

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-29 19:49:37 UTC
From: Dick True
Topic: 1721 Message: 1721

Does anyone have this combination working yet? The earthmate works just fine with TinyTrak3 but am unable to get it working with the KPC3. I have the DTR line to the earthmate pulled up and I can see the data flowing to the KPC3 but it never transmits location or status. If I conntect my Garmin GPS II+ in place of the earthmate (with the correct cable) then everything works ok. Any thoughts on this?

Hi all,

Great group, lots of help.

I would like to build an I-Gate. I run hang gliding competitions throughout the US and would like the hams who are pilots be able to show up during the contest. I did this 5 years ago but just used the backbone of the exsisting Florida I-gate I currently use a Kenwood th-d7a. The US National's are in Texas this summer.

For building an I-Gate - what are the basic hardware, software and internet connection needs? Any info to gurus, greatly appreciated.

Thanks

Dave-
I also have the Kenwood TH-D7 and it is the only ht on the market with any APRS capability built in. However, it does not fully support APRS. It is "Mic-E" complaint, and displays one digit less lat/lon than a normal GPS will. It doesn't support compressed posits on APRS. Also, when used in APRS mode in consumes a fairly high amount of power.
If this all sounds like greek to you <G> that's the way APRS is. You may want to get familiar with the options in APRS and make sure the D7 supports enough for you, before you decide on it. Make haste slowly.

And incidentally...the D7, like many HT's today, comes with a wideband antenna that is apparently designed to work over the larger frequency range that the radio can receive. As a result, it is also a lousy antenna in the ham bands. Another $24 to Diamond, Comet, or other vendors will get you an antenna that can literally give you another 3-5 S-units in the ham bands, plan on that.

1724. MFJ 1270 Help!

From: Ronny Julian
Topic: 1724 Message: 1724

I have an MFJ 1270 that seems to work fine but is a bit weak on transmit. I swapped it into a known working setup and it turned out to rcv good but not transmit much at all. I can hear a bit but its weak. The only change made was going from a Rose switch firmware to the latest MFJ Firmware.

Anyone have the alignment procedures? I could send it to MS but I'd rather learn in the process.

Thanks!

Given enough time anyone can resolve their own problems! Yes, the combination does work. Just make sure the KPC3 has abaud set to 9600 as the earthmate transmits at that speed. I had the KPC3 set to 4800 to support the Garmin GPS ll+.

From: skagitjim
Topic: 1728 Message: 1728

Greetings,

I'm relatively new to HAM and APRS, but I have a Kenwood TH-D7Ag hooked up and working fine with a Garmin GPS. My question is, can the Kenwood be set up to do voice on one band and data on the other band simultaneously?

I am mainly into APRS for search-and-rescue, and it would be nice to have one radio do it all rather than one for APRS and one for voice.

Thanks,

Jim KE7AHT

Any on the new ones work well. The older ones need output to nema 183 (2.0) versions and 4800 baud to be plug and play. If your position decimal points are blinking then nema string is being recvd. You have to have tnc on and gps set to correct nema output, also be sure you really plut the gps into the gps port on the radio, bottom one, many have thought something is wrong when in reality they are just plugged into the pc port, how could anyone be SO STUPID, ;)

Yes, you can set up the Kenwood to recieve voice on band a and aprs on band b. Just open the tnc on Band B, tune to the needed frequency, and then swith to Band A for voice.

Jim-
Yes and no. The D7 has two VFO's, so it can receive both voice and data at the same time. But it is only one simplex radio, so you can only transmit voice OR data at any one time, and while you are transmitting you receive nothing.
When you are transmitting voice, the APRS section will wait and not send anything until you are done. And you will not receive APRS data while you are transmitting.
It has limits, but there's no other ht capable of displaying APRS data all-in-one. Look over the limits carefully, the D7 does not fully support APRS in all ways. You'll still need a real TNC and a larger bundle (radio, tnc, gps, display/pda, etc.) to do that.

I just put together my aprs tinytrak 3. I am using a yaesu ft-530 ht with a garmin gps38. My question is when i am programming the chip for the tinytrak, there is a spot in the program under the callsign saying "digipath" i am not sure what this means.

I hooked everything up and it is transmitting and all the lights on the tinytrak are on, but my location does not show up on internet. Any help would be appreciated...

Thanks Eric-N8TEV

1733. 30 Meter Policing needed.

Yahoo group: APRS (1998 — 2006)
Date: 2004-06-04 15:55:55 UTC
From: Scott Weis
Topic: 1733 Message: 1733

Hello all,

Last night was a very good night for 30 meter propagation, I was watching it all with my KAM XL and MixW. I did however see some problems. Anyone who runs a station on this band needs to take a look at their stations and make sure we are all on the same frequency. I was seeing stations on both sides of the center of 10.149.3. Some by quite a lot. I even saw 1 station transmitting outside the 30m band. I have found the MixW software waterfall display quite useful in finding all of this. We should all check to make sure our mark and space are being transmitted on 10.149.2 and 10.149.4. Here is something I found that may be helpful.

Packet TNCs output two tones that represent a mark and space. The HF tones are 200 Hz apart (VHF 1000 Hz) regardless of the actual tones the TNC uses. Each TNC manufacturer may use different tone frequencies. For example:

TNC HF LOW TONE (Hz) HIGH TONE (Hz) CENTER (Hz)
MFJ 1600 1800 1700
PK-232 2110 2310 2210
KAM 1600 1800 1700
KAM XL 2125 2295 2210
KAM 98 2125 2295 2210
PACOMM 1600 1800 1700

The method for calculating the desired DIAL frequency (freq) is:

ASSIGNED FREQ = LSB DIAL FREQ - CENTER FREQ (TNC)
ASSIGNED FREQ = USB DIAL FREQ + CENTER FREQ (TNC)

So for APRS of 30 meters.. Assigned Freq is: 10.149.3

For a 1700 Hz center using LSB the freq would be 10.151.0 and USB would be 10.147.6.
For a 2210 Hz center using LSB the freq would be 10.151.51 and USB would be 10.147.09.

So could we try to all get on the same frequency so we have one network on 30m please??

Thanks and 73

This tells the network around you how to retransmit your packets. Make it
something like RELAY,WIDE2-2

>I hooked everything up and it is transmitting and all the lights on
>the tinytrak are on, but my location does not show up on internet.

Your packets are not making it to an IGate. The digipath may help (assuming
you can make it to a RELAY digipeater, and that there's an IGate within 2-3
hops of you).

1736. Setting up a digipeater

Yahoo group: APRS (1998 — 2006)
Date: 2004-06-05 16:31:46 UTC
From: Roger Banks
Topic: 884 Message: 1736

I've finally gotten my weather station
<http://www.findu.com/cgi-bin/wxpage.cgi?call=ke5aqd-7&units=english&last=24>
set up and working. But now that it's working it seems like a waste of
resources just transmitting weather data every ten minutes or so. I'm
thinking I should go ahead an put my transceiver and antenna to better
use as an digipeater and I-gate. To that end, I was thinking about
ordering a Kantronics KPC-3+ for the digipeating part and installing
UI-View on an old laptop for the I-gate part. My question is this; with
the radio and the laptop plugged into the tnc, where does the weather
station fit into the scheme? Can I run a digipeather/I-gate *and* a
weather station from the same setup? Thanks.

People need to be aware that to get on the right RF frequency for HF APRS, you MUST know the audio frequency that your TNC puts out.

Here is list which show the frequency to dial up, once you know what your TNC audio frequency is.

Mike VK2BMM

Mike,

On 6 December 2003, I wrote the following message on this topic, and
received no comments. I agree with your message, but still observe
the same frequency errors. Here is my message again in case there
may be further comment upon it.

Subject: 30-m Operating Frequency

Hello,

I'm new to APRS (both on VHF and HF). I have no problems on VHF.
On HF, 30-m, 10.15150 MHz, I notice that the beacons
from the gateway stations are right on frequency. However, I notice
that there are many stations which are off frequency by as much as +/-
50 Hz. Of course, when they are over about 10 Hz off, I have
problems copying them and must retune to see who they are.

As I understand, the precise frequency I should be operating at
(considering the offset in my TNC of 2210 Hz) should be 10.15151 MHz,
but I find that the gateways seem to all be on 10.15150 MHz.

So, I would like some comments about why so many stations on 30-m
seem to be off. Poor frequency control? My problem?

Thanks & 73,
-Joe-

1742. kpc-3 as node - HELP please!

Yahoo group: APRS (1998 — 2006)
Date: 2004-06-09 02:38:28 UTC
From: wealthfunnel
Topic: 1742 Message: 1742

Hi, this is Dave WA4NID, and I am trying to set up an APRS node with Kantronics kpc-3, and following this link:

http://www.ke4nyv.com/aprs.htm

but I can't get the node to appear on findu.com

The radio is sending modulated output, and it is using an antenna system proven to work for local aprs.

Does anyone have settings for this, that I can check and compare to what I'm trying?

THANKS!

73,

Dave WA4NID

Dave try this site out it has a little more information on settings. http://www.nwaprs.org, click on "APRS Settings" then click on "Wide Digi Site KPC-3/+" This should help with your digi, just change some of the parameters to fit into your areas recommended paths, transmission rates, etc.

Steve,

There are no APRS repeaters. There are stations that are NODES or DIGIPEATERS. these stations retransmit your signal. They are located everywhere. Probably right in your community.

My mistake. I used the wrong terminology. I meant to ask if there is a website which lists digipeaters nationally simular to what can be found at http://www.artscipub.com/repeaters/ for voice repeaters. I am familiar with the Digis in use in my region since my REACT Team is the on that put them up and maintains them. What I'm interested in are Digis located out of state since I'm about to go on vacation and wanted an idea of what kind of coverage to expect along my route.
Thanks,
Steve

Steve, afaik you have to run APRS software on your computer, let it gather
stations for the area you are interested in, and look at the results there.

Got a question on that line of APRS repeaters. Can one filter WINAPRS to just digis? That way if you?re running an internet connection AND the TNC would you get all digis for the area your hunting in? I am new to WINAPRS but have run the CE version for a while now.
Thanks
Dakota

Howard,
Thanks for the reply but I'm still not being clear about what I was
looking for. I use APRS with Ui-View and Precision Mapping and have
NO problem seeing Digis, most of which were put up by my REACT Team,
within a hundred miles of my home. When traveling I get digis which
are about 50 miles out. No problem.
What I'm interested in knowing in advance are which areas I will be
passing through on vacation, which will take me approx 2,000 miles
from my home, have digis and what kind of coverage I should expect.
I know that there will be some areas, such as Kansas where I may
drive for hours without my packets reaching a digi. A website
simular to this- http://www.echolinkmap.org/usa/usa.htm where I
would know beforehand that after passing through Wichita I will most
likely not be heard again until reaching the Denver area is sort of
what I was looking for.
I'm just trying to establish where to expect the gaps in APRS
coverage so that family members who are tracking me on Findu.com
will know that in certain regions my position will not be updated
for quite some time.
Thanks,
Steve, KC5SAS

1752. WINAPRS Elmer needed in SOCAL

Group,
Let's talk hardware for awhile. I have to tip my hat to Byon for a great product. I sure have enjoyed building and using the TinyTracker. As it has evolved I'm sure Byon has received many requests for changes and upgrades and more features. In fact he has encouraged it. Now along comes the OpenTrack module. It sure looks and smells like a TinyTrack but its not. It sure is taking a beating on other news groups. (change?) Scott has take a different track with his hardware, but I think there are some neat features here. For one, while using the OpenTrack mobile I like the ability to monitor my vehicle's battery voltage. There have been a number of concerns with the power consumption with the TinyTrack of which the LED's contribute quite a bit. The OpenTracker uses one LED with blink codes. This is great. Something for the next TinyTrack version? A change like this could allow the TinyTrack to add features since it frees up a couple of ports on the PIC. Next thing you know the new SMT versions of both will end up inside your mike.

Great going you guys! Great kits! Keep em coming.

Lets see some APRStt kits if this is included in some of the newer APRS software programs such as UI-View. Would be of great use at public service events.

Thanks for the bandwidth.

Steve,

Can you connect from home to the internet using UI-View, MacAPRS, WinAPRS or Xastir?

You'll be able to get a clear idea of what areas have coverage and what don't.

From: db2fm
Topic: 1753 Message: 1759

Don't mix protocols and hardware here, please!

OpenTRAC is a newly developed protocol, different from APRS, but with nearly the same goals and easier to parse formats and better extendability.

The OpenTracker was developped by Scott Miller to test his new protocol on a hardware like the TinyTrak. Features are:

++ OSI Certified Open Source Software
++ FLASH memory allows firmware to be updated or replaced in seconds (PC with serial port needed, no programmer)
++ On-board temperature and battery voltage sensors
+ Uses the same cables as the Kantronics KPC-3/3+ and Byonics TinyTrak3
+ Low power consumption - about 9 mA @ 12 V
+ SmartBeaconing™ support for adaptive transmit rate
++ APRS™ support for position, course/speed, altitude, symbol, and comment
(and temperature and voltage reporting in comment, if selected)
++ OpenTRAC support adds GPS signal quality reporting
+ Dual-Protocol mode selectable
+ timestamp can be added
+ APRS™ compressed position formats (optional)
+ 1200 baud and 300 baud firmware versions available
++ Can optionally omit digipeater path above specified altitude
+ Uses $GPRMC and/or $GPGGA NMEA sentences
+ Quartz crystal clock source for excellent temperature stability
++ Dual configuration support - selectable by jumper, voltage, altitude, speed, or temperature

1760. APRS configuration?

Yahoo group: APRS (1998 — 2006)
Date: 2004-06-15 20:35:38 UTC
From: n9wys
Topic: 1760 Message: 1760

It been a LONG time since I was last involved with any packet radio... I just downloaded a copy of UI-View and started up my station again for APRS. However, I'm confused as to what parameters I need for proper operation.

I'm running an older KPC-3 (v6.0 firmware) on my Motorola Syntor (85w). My questions have to do a lot with the beacon and station parameters, and what I need to have set so the station will act properly as a digipeater.

In the STATION SETTINGS section of UI-View, it calls for UPNROTO ADDRESSES. In there, I was told by another ham to enter "RELAY,WIDE,3-3". I've seen other stations beaconing RELAY,WIDE3-3" (no comma after WIDE). What is the significance of thses particular words, and the "3-3", and is that (3-3) what I should enter for proper operation?

Finding documentation about these parameters seems to be the most difficult task. Also, if there are any other suggestions as to how to best configure my station, fire away! I'm all ears!

Thanks es 73,
Mark - N9WYS

Note that in UI-View32 the proper unproto address always starts with APRS
(Read the help files in UI-View32, they are excellent and should answer most
of your questions)

APRS,RELAY,WIDE2-2
APRS,TRACE2-2

etc.

85 watts ?? Hope you're WAY out in the sticks!! I've been running 12 watts
for years and it's always rock solid into the digi 18 miles away. At 85
watts you take a real chance at keying up stuff you can't even hear, not a
good thing.....

Subject: [APRS] APRS configuration?

It been a LONG time since I was last involved with any packet
radio... I just downloaded a copy of UI-View and started up my
station again for APRS. However, I'm confused as to what parameters
I need for proper operation.

I'm running an older KPC-3 (v6.0 firmware) on my Motorola Syntor
(85w). My questions have to do a lot with the beacon and station
parameters, and what I need to have set so the station will act
properly as a digipeater.

In the STATION SETTINGS section of UI-View, it calls for UPNROTO
ADDRESSES. In there, I was told by another ham to
enter "RELAY,WIDE,3-3". I've seen other stations beaconing
RELAY,WIDE3-3" (no comma after WIDE). What is the significance of
thses particular words, and the "3-3", and is that (3-3) what I
should enter for proper operation?

Finding documentation about these parameters seems to be the most
difficult task. Also, if there are any other suggestions as to how

I might also note a large factor in setting Relay Wide 3-3 etc. has to do with local infrastructure. Not all Digi's support that protocol for some reason. People who run the digi's need to keep up with the latest protocols from Bob and others. I would check with local APRS ELMERs and ask them what the majority of ops in your area run.

I expanded my I-Gate reception range to see what was out in your rarea. I looked up your call and got the location. There is an I-Gatee about 35 mi or so to your NE and a digipeater about 30 mi E of you. An unproto setting of aprs,relay,wide should get you into either of them. You can use aprs,relay,wide3-3 but its not needed unless you want to increse your range. Please don't run 85W if you can use less. It also reccomended not use anything higher than Wide3-3. It just increases congestion on the frequency. Go to www.findu.com and look up W9AZ-15 or KC9XG-3. You can get aa list of stations near them that that will give you an idea as to how many people are running APRS in your area. dAVE

Date: 2004-06-18 14:52:08 UTC
From: N9WYS
Topic: 1760 Message: 1765

Well, I guess you could say I□m □in the sticks□ :-)

I□m about 15 miles west of Joliet, IL, on the borders of Grundy, Kendall and Will counties. From what I□ve seen so far, there is nothing, other than one station about 20 miles south, within about 35 miles of me. (I do know there is another station to the immediate north of me, but he runs only about 2w.) Other stations in my area and to the west are looking for a digi to use □ that□s why I□m trying to get setup. Unfortunately, there□s not much out this way (about 60 mi. SW of Chicago). The closest □node□ - if I can call it that - is the W9AZ in University Park □ ~35-40 miles east of me.

The radio I□m using is a Motorola Syntor, originally designed for 110w transmit - when I converted it for packet, I dialed down the power to 85w. (The receiver opens at about .15 µv, so I□m hoping it can hear as far as it can transmit...) I don□t want to go much lower on the transmitter, as the PA will become unstable. Plus, I□m in kind of a hole □the DuPage River is just east of me □ so my location isn□t the best to transmit out of. (Terrain rises substantially to the west and east of me.) My antenna location at 35 ft doesn□t even get me level with terrain to the west

```
I just set up UI-View32, and used most of the configuration settings I had
in the 16-bit version. Seems from some of the reports I got from other
stations while running that version that I was doing OK.
```

I think with being a base station, and having the transmit capability that I do have, I would not want to □RELAY□ □ am I correct? I think I probably want to configure something like:

```
APRS, WIDE3-3

Correct ?????

Mark

From: Ron Cluster
Topic: 1760 Message: 1766

APRS,WIDE3-3 (no space after the comma) is an acceptable path to use, at least in my area. We recently changed our recommended path for a home station to TRACE2-2. In UI-View32 that would be entered as APRS,TRACE2-2. You should check and see what folks closer to you are using.

Your radio sounds like a fine radio but you're probably going to be transmitting over the top of stuff that you can't hear, especially if you are down in a hole. Doesn't help the system out at all. Put a digi up where it can hear the rest of the system, and you can hear it, and then use 10-20 watts to hit it.

Talk to that guy that's only running 2w. Maybe his location is a good site for that digi.

1767. Need help in Salinas Calif

Yahoo group: APRS (1998 — 2006)
Date: 2004-06-21 01:22:20 UTC
From: Dave Becker
Topic: 1767 Message: 1767

A friend new to APRS, W5FBK Dave, is in Salinas and
trying to hook up his TM-D700 in his 18 wheel truck.
Anyone in that area willing to help him? I don't know
much about it so can't be of much help from up here in Washington.
It's not exactly just plug and play, is it?

He will be there for a few more days but has no access to
Internet. It's a new radio and gps unit so he has the manuals.

Maybe he could call someone on the phone and get talked through
any setup???

Thanks
Dave

1768. RELAY, WIDE2-2, what do I select?!?

Yahoo group: APRS (1998 — 2006)
Date: 2004-06-24 04:44:08 UTC
From: eoppie@yahoo.com
Topic: 1768 Message: 1768

I see that I am getting out on FindU most of the time, however I want to know what the best settings for me to input. I am confused as to what RELAY and WIDE mean, as well as why if they are entered in vice versa it could work, or not work.

Could someone shed some light on the issue, as well as give a reccomendation as to what the best settings are?

By the way, I am located at Zip: 32821 in Orlando Florida.

Hello to the group, from Trish - WA6UBE ..

I recently purchased aprspoint, and have also
built-up an APRS tracker unit from a kenwood
TH-D7A(G), and a Garmin GPS-III+; self-contained
with a 12AH gelcell battery pack ...

Beacon callsign > WA6UBE-9 <

Hoping to learn more details about APRS ...

Trish

I have not used APRSPoint so I won't try to make any comparisons between it and UI-View32 other than this: UI-View32 runs you a bit under $20 USD and Precision Mapping from http://undertowsoftware.com costs $50. For $70 you get street level detail for the entire US (and Canada with the next version of Pmaps due out in July) and you get a top-notch APRS program too. The best one around in my opinion.

Check out UI-View32 at http://www.ui-view.com

Not connected with either company, just an EXTREMELY satisfied user.

Hi Gene and all!

I was going back through some old emails I wanted to reply to and found this.

Gene, I have always had my Emap working fine with the D700. The thing I wanted to address was getting station LOCATION INFORMATION to show up ON the Emap display.. Right now it's a one way conversation the Emap reports my position to the world, but I can't see OTHER stations actually ON the Emap that's what I would like to be able to do.

Thanks!

Martin,

A users manual was included in the box with the radio (or available online from www.kenwood.net) that when actually opened to page 10, the connections for hooking up a GPS to the TMD-700A are shown.

1779. FS or trade DGPS boards for HH GPS w/power/data

Yahoo group: APRS (1998 — 2006)
Date: 2004-06-27 12:17:04 UTC
From: Ronny
Topic: 1779 Message: 1779

I have 5 12 channel DGPS boards that would make great trackers.

$25 each + shipping with full documentation or trade ALL 5 for a good handheld GPS with power/data cable. I'd like to trade more than sell then separate but either way.

They are almost the same size as a tinytrack 3. Female SMB connector.

Please reply OFF LIST direct to k4rjj@"nospam"comcast.net Remove the "nospam" with offers all 5 will fit in a USPS priority mail box with an antistatic bag and packing.

Would the setting for a HT be specific for its use? Set it for the car designator if that is its primary use? Not sure what the designator would be for the HT itself, if it wsa used primarily as a walk around unit, not specific to a vehicle. Thanks.

1785. tinytrak2 and ft-1500

From: Broncus
Topic: 1711 Message: 1786

Drivers? They don't need no stinkin' drivers!

Seriously, the digitraveller outputs serial data at 4800, none, 1.

Now if you lost the DelLorme software that is another story. However, any GPS (just about anyway) can be used with that software as well.

Best regards,
Fred

I have a Garmin 176C GPS and Laptop with wireless Internet access. Would like to get started in APRS mobile. On my job I use the GPS plugged into the laptop and run the Delorme Street Atlas Program. With the Delorme program and GPS I can find the next coordinate that our company plane gives me for encroachments.

Would it be possible to still use the laptop, GPS and the Delorme Street Atlas Program and a Kenwood Mobile TM-D700A?

Would the Delorme program still work or run while running APRS?

What I have a problem understanding is how do you get the GPS to send information to the radio and also to the laptop?

Really need some info on this before I invest in the radio. Any help would be appreciated!

Thanks for the help,

Fred Marx

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-03 13:35:18 UTC
From: aprswatcher
Topic: 1787 Message: 1791

Make sure your kpc-3+ is on prior to starting up your APRS+SA program. The software will send the proper commands to the tnc, the only one that I change is the "CD" command {carrier detect} click on the "TNC" tab, at the bottom of the window is a small one line window, click in this window and type in "CD Software" and hit enter, this allows the software to detect the carrier signals instead of the tnc software, you can then open the squelch on your radio, the green "Rcv" led should remain extinguished until a packet is received.
If you want to view all aprs traffic click on the "traffic" tab, if you want to see messages only to you and from you click on the "Messages" tab, the uppper window is what you have SENT OUT, the bottom window is what you have RECEIVED.
If you want to send a message to a specific station, from the "Position" page highlight the station you want to send the message to, then right click once, this will bring up a new menu, about 1/2 way down is "Send message to", click on this and a new menu will appear, the callsign should appear in the first box, use the tab key or mouse to move to the next box, "Message text" enter your message here, APRS messages are short "one liners" so you can't send real long messages, unless you send several. Click on "Send" to send your message out.
As with any windows program there are several ways to do a task, ie to send a message just hold the "Ctrl key and press 'M' key" this will bring up the same message window.
Hope this helps out!

Someone else correct me if necessary, but don't the AEAs of that era need to see an asterisk (aka *) from the host computer to set autobaud? (The sequence being TNC restart, * from the computer, which lets it lock onto a baud rate.)

< Just make sure you only split the output from the GPS, not the input to it. >

A good way to do things, but not always necessary. NMEA devices can be "talkers" or "listeners" or both, as the GPS and laptop can be. NMEA allows for full "Y" splitter cables, as long as somone or something ensures that all of the "talkers" on the bus are being controlled to prevent chaos.

So, if the PC with the DeLorme software was being used to SEND DATA to the GPS, and the RADIO was also being used to plot received APRS waypoints, again SENDING DATA to the GPS, there would be two talkers both sending data to the GPS. Without some control, the GPS could go nuts with data coming from both at once.

Making the cable so that only the "data out" from the GPS is split will solve that problem, by only allowing it to "listen" to the PC or the radio. If you use DB9F plugs for both "output" legs of the cable, you can switch data sources by switching the "live" plug. But you can also do that by putting a small switch on the data line, on each plug. Or, even simpler, if you are sending any data to the gps from one of the devices (radio or computer) you can just make up a "Y" cable and ignore the problem completely. Since "data in" and "data out" or rx/tx are reversed as you view them from device to device..."Cut once measure twice".<G>

Depending on the wire gauge and the power of the GPS itself, NMEA signals can often deal with about 20-25' of wire in a "Y" cable. And a physical "daisy chain" instead of a "Y" is also perfectly acceptable.

1796. Question regarding beacon rep rate:

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-05 17:46:36 UTC
From: Trish & Carla
Topic: 1796 Message: 1796

I'm a bit new to APRS, and was wondering about
"rules of thumb" here ...

When I'm parked, and know that I will not be moving
for a while, such as parked in my parking space at work,
or at home, I set the beacon rate to every 30 minutes ..

When I know that I'll be driving around, and also know that
I may not be parked in any one place for more than an hour
or so, then I set the beacon rate to every 5 minutes ..

Are this settings considered "typical" ??

Also, if I know that I'm going to be driving at fairly high
speed and will be on a freeway or expressway, and not just
surface streets, is a beacon rate of once per minute considered
flooding the network ??

Also, since the "find-u" web-based mapping link that I use,
only updates once every 3 minutes, it would make sense for those
that check my location via the find-u system, that my beacon rate
of a five minute interval would be more appropriate ...

Any thoughts/comments ??????

My vehicle is located at:

<http://www.findu.com/cgi-bin/find.cgi?call=wa6ube-9>

Trish ..

1797. Vandalism Notice

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-06 18:31:43 UTC
From: Robert R.
Topic: 1797 Message: 1797

I am posting this as a reminder to all hams.

We get complacent with our vehicles and all our radios (toys)
that we've taken time to install to our individual liking.

Complete with antennas abound.

Please stop and think about the possibility of one day
that all could be taken away.

I had a vandalism about 2 weeks ago.

My FT-100D was taken, along with a LDG antenna tuner.
Besides the small stuff that was taken, torn, yanked out of the dash,
in addition to ham radio equipment, insurance is not wanting to cover the
equipment that was "Installed" or "Wired In" as the adjuster
called it.

I'm only getting settlement on the few small items I had
in the truck. And saying they were bolted down, seemed
to make matters worse for me.

If I had the Yaesu and tuner lying on the seat
NOT CONNECTED TO ANYTHING
they would of covered them with no problem.

They are even debating to cover a radar detector that was
in the glove box (not connected) !

The adjuster said as an example: Suppose you had a cell phone
in the glove box and it was taken. That WOULD be covered.
But, if the cell phone was plugged in to the lighter socket
being charged, that WOULD NOT be covered.

Seems that insurance companies just find a way
to get out of paying for the most expensive items.

I am now looking into the ARRL insurance and see
if it is any better.

Our call signs can be looked up on the internet with ease.

Bottom line: Check your insurance policy. Call them to make sure
what is and is not covered. Before it's too late.
Pictures and receipts do not seem to matter these days.

Robert in Phoenix, AZ

1799. Re: [APRS] Vandalism Notice

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-06 21:21:00 UTC
From: Mike WA6ILQ
Topic: 1797 Message: 1799

It's a fact of life that insurance companies are in the gambling business and for them it's legal... they roll the dice with every policy and they are betting that they can make more money than they have to shell out. The fewer claims they pay the higher the profits.

Just out of curiosity, since my insurance renewal is coming up, what insurance company do you suggest I should avoid?

BTW I'd go back to that adjuster and ask him if the fact that it was professionally installed makes any difference?

Then comment that you may be buying a new vehicle and do they cover dealer installed optional equipment - like OnStar?

If that does not get him to reconsider his stance, I think it's time for you to have a chat with the insurance company regional office - just call another broker's office and ask for the number - and in your phone call to the regional office first ask for the state insurance commissioner's phone number.
That puts them on notice that you expect to have to go higher.

Then discuss your case. Point out that you are a emergency communications volunteer and had your own personally owned equipment installed in your personal vehicle, using procedures suggested by professional installers and following guidelines provided by the national organization based on past experience with insurance companies (yes, the ARRL suggests that you bolt the stuff in), and you would like an explanation why they are refusing a claim on properly installed equipment?

In my two theft cases I had a 3-week old Midland 13-513 (the first synthesized 220 mobile) and an HT-200 handheld stolen from my car and BECAUSE NEITHER WAS BOLTED IN they weren't covered.
And ten years later a Yaesu FT-720 was covered because it was.

The insurance company I have (soon will be HAD) now is American Family.
I've printed out the ARRL insurance web page, along with the inputs found
on eham.com. Will probably go with them.

Got screwed once, not again.

Thank you for the info. I'll avoid them.

Please do some followup and see if you can get them to change
their mind - nothing ventured=nothing gained and if you don't ask
they can't say yes. And if the higher-ups say no, what have you lost?

The "general" rule is that if it's mounted or plugged into the car, or even designed to run on 12V, your car insurance covers it (sometimes you need a rider) and if it's "portable" your homeowners insurance pays - again, you may need a rider. And, yes, they'll do EVERYTHING they can think of (and they've have LOTS of training in that) to get out of paying a claim.

From: Ronny
Topic: 1803 Message: 1803

I just got one of Bucks Rascal interfaces. Can this be used with a DOS based laptop and APRS-DOS? I know it can run under Windows with many programs but I want to have a two way APRS program running under DOS. Mapping is not much of a concern as the user of this system is blind and will be porting the text through a synth TSR type program. His machine has plenty of memory. Thanks for the help in advance.

Robert-
The only way to make progress with your insurnace company is to do it by the book. I've been there before.
You need to read YOUR POLICY, not believe what the man says. Then your policy and their actions and choices are governed by your STATE INSURANCE LAWS and there is usually a state "consumer affairs" or "insurance department" or "insurance commissioner" whose job is to make sure those laws are followed.
What your insurer does is often a violation of their contract, a violation of the state laws, and if if you or I did it, it would be called criminal. Sometimes they are within their rights, other times some idiot is trying to reject valid claims in order to make a name for himself. But unless you can catch them violating YOUR POLICY and your state laws, you've got nothing. They rely on the fact that very few people ever sve their original policy, or can read their current renewal policy, or will bother to question their action.
Some policies will state up front that installed equipment is not covered unless they are notified of the installation, so they can adjust the value of the vehicle. If that's what they are following...they may be entitled to do it. But a supervisor may be willing to cut you some slack, you won't know unless you ask. And, know your policy.

1808. etrex and kpc3+

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-10 14:37:38 UTC
From: George
Topic: 1808 Message: 1808

Hello has anyone had any experience connecting and configuring an etrex to a kpc3+? it seems that the "lt" buffers aren't being filled, and no transmit. I have the kpc3+ ver 8.3 set to

gpshead 1 $GPGGA
LTP 1 GPS VIA RELAY, WIDE
BLT 1 every 00:03:00 CLEAR
Gpsport 0 (using the rs232 port)
Abaud 4800 (same as GPS)
Intface GPS

If I place text into the "lt" with the "lt" command then it transmits the text.

The etrex is outputing data when veiwed on my loptop with hyperterm.

1809. GPS enable for UI-View32

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-13 18:48:26 UTC
From: n9wys
Topic: 1809 Message: 1809

I posted this to the UI-View group, but haven't gotten any help so far there, so I turn to the larger group. The reason I'm a bit impatient is that we're expecting severe WX (actually it's starting occur now) in the Chicago area today, and I'd like to use my mobile station to report my location while out weather spotting...

I'm trying to get a "generic NMEA" GPS to work with UI-View32. So far, I've had no success.

The GPS is a HOLUX brand unit, Model GM-200UBK, to be specific. The GPS is a USB unit. Software that comes with the GPS installs a "Prolific USB-to-Serial Port" on COM4. I've used this GPS successfully with DeLorme Street Atlas USA (2001 version) with the USB-to-Serial Port setup. In fact, this is why I am trying to use this particular GPS with UI-View.

The GPS seesm to be working properly - a series of 4 LEDs on the housing blink, which indicate that the unit is receiving GPS signals. However, when I activate the GPS in UI-View, UI-View runs EXTREMELY slowly, CPU usage increases to almost 90%, and the GPS does not send position data to the program. (In essence, the program so much as "locks up".) If I physically disconnect the GPS, UI-View resumes normal operation.

I have the following options selected in UI-View:
Baud Rate 9600 (I've also tried 4800 baud with similar results)
COM4
GPS Enabled (F8)

The station itself seems to work just fine. When I turn it on (without the GPS) it beacons the coordinates I input during setup - my home QTH. The only problem I'm having is configuring UI-View for this particular GPS unit.

Can anyone help with this? I am a severe weather spotter, and the local NWS office (Chicago) is running APRS with UI-View to see where spotters are when deployed in the field. Being able to use my mobile APRS station would be of great help to me during these events.

Thanks!
Mark - N9WYS

From: KC2MMi
Topic: 1809 Message: 1810

Mark, I'm not familiar with that GPS or the software driver for it, but have had similar experience with the DeLorme usb/serial emulators. DeLorme's simulator places the USB port as "COM0" which is an illegal COM port address. Software which expects to find the conventional COM1-4 addresses will never work with it.

So, my first suggestion is to use Hyperterminal or another basic terminal program, connect to the COM port [sic] you think you are using, and see if there is any data streaming in.

DeLorme's usb-as-serial emulator also lays a land mine, once it has been installed it is pretty much invisible--but it forever traps the USB data, so other software (which CAN use a USB GPS) may never be able to, until the earlier software has been uninstalled. If you had installed the DeLorme software on that computer, uninstall it now, uninstall the new software, restart, then trying reinstalling the new software so it is a clean install.

Good luck with it.

OK, I☐ll try the Hyperterminal thing.

Again, my GPS (a HOLUX brand unit) comes with its OWN software, which installs a ☐Prolific USB-to-Serial Port☐ configured on COM4 ☐ not Delorme☐s software for the usb-to-com port. Also, if I have the GPS running in the Delorme program and try to find it with UI-View, I get an error message in UI-View that ☐the COM port (in this case, COM4) is already in use☐ It is this that makes me believe it isn☐t the COM0 you mention, but I☐ll check anyway.

Joe, between the GPS, tracker, and power sources you may need a sherpa for your child. Are you aware that there are "wristwatches" that are sold commercially with tracking and location software already available? Plus, it looks like some kind of fancy wrist watch so the kid isn't dragging around an equipment rack.

I have the D7, in fact I've just been playing psychotherapist for it because it has once again "gone mad". The microprocessor or memory inside has gone corrupt and will probably require a trip back to Kenwood. It IS the only ht with any kind of built-in APRS capability, but it does not support all APRS functions and it only shows position to 60' using the Mic-E subset and DDD.MM.mm position resolutions, not the normal DDD.MM.mmm displayed on GPSes these days.

So it is the only way to go tracking in the field with one integral unit...but it has some drawbacks. There's a Kenwood THD7 group here on Yahoo! as well, if you want to get opinions. (Or feel free to email.)

Subject: [APRS] Can I Use an NDI HC-1400

Hi all.
I was wondering if i am able to use a NDI HC-1400 for APRS in my van with out having too much trouble wiring it to my KPC-3?

Also if someone has a diagram or instructions on where to tie into the radio (Mic or AUX jack) could they please send it along?

Thanks in advance.

1823. Help with APRS via sound card interface

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-21 09:29:54 UTC
From: Ronny
Topic: 1823 Message: 1823

Would someone have a bit of time to help via internet (MSN,Yahoo,ICQ etc.) in getting my system tuned up? I was able to transmit my position but can't decode packets. The radio is hearing packets fine.

http://www.findu.com/cgi-bin/find.cgi?call=K4RJJ

I have changed radios, sound card interfaces, and cables twice. I think this is coming down to software and/or volume levels.

Thanks so much.

K4RJJ Ronny

1825. Re: Kenwood TH-D7A(G)

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-17 21:21:11 UTC
From: Dan
Topic: 1815 Message: 1825

I've been using a TH-D7A(G) for about 9 months. I find no faults with it, and can speak honestly when I say I like it. This is my 2nd Kenwood hand-held, by first being a TH-77A purchased in 1991.

I found cables to be the hardest part, in getting the D7 to work with my computer (Macintosh PowerBook G4 through an USB port, with a Keyspand USB-to-serial adapter), and my Garmin eTrex Legend. Once I had the right cables, the rest was easy.

You can talk on channel "A" while channel "B" tends to the APRS automatic position sending.

Again, there is nothing I don't like - except perhaps the "stock" antenna. I replaced it with
a Diamond SRH77CA "high gain" antenna for about $35; a significant improvement.

1828. TNC or sound card

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-22 20:55:32 UTC
From: ffdjeff
Topic: 1828 Message: 1828

I am about to start my home APRS station. I will use it for weather data as well as a possible Digipeter. The radio is a older Kenwood TR7400A. I was planning on using a Tigertronics SL-1 utilizing the computer sound card. Am I ok doing this or should I consider using a TNC? I hope this stirs up a discussion as I would like to see both sides of this.

Hi Jeff you might check out mine. I am using a combination WX/Tnc
designed by K0RX. You can't use it as a Digi but it works great and
is fairly cheap under 200.00 to build. There is a link to Rxcomm for
more info.

One word of caution about the K0RX WX/Tnc referenced below. On his WEB page he claims that it works with ALL versions of the Dallas 1-wire anemometer. This is not so! I have an original version 1 1-wire anemometer and his system does NOT work with it. He refunded my money rather than fix the software so that it would work. I would have preferred to have it work!!!

From: ffdjeff
Topic: 1832 Message: 1832

Thanks for the responses but I left out some information. I am currently using the Peet Brothers weather station. I want to start my APRS station using the Kenwood TR7400A. My question is, is it better to use a TNC or can I use the Tigertronics SL-1 that I currently have, utilizing my sound card. I am not sure which technology is better for APRS, using the computer sound card or a TNC.

Thanks
Jeff

Either tchnology works fine the advantage pf using the sound card is that with 2 sound cars it is possible to run VHF and HF a lot less expensively. If you you don't have a TNC or only 1 serial port you'll probably want to try the sound card for a start

For a home station, there is very little benefit to the Kenwood D700/D7, at least in my opinion. Save those for the mobile/portable use where they really work nicely.

My recommendation for a home station:

Windows (Blah) PC running UI-View32 (Currently not able to register this program due to Roger's illness but I am certain that will be resolved soon). I'm no fan of Windows but UI-View32 is spectacular so I put up with it for this application. I have ran UI-View32 under Virtual PC running on a G4 Macintosh and that worked out fine so that is an option if you want.

Pretty much any 2m radio. If you are close to a digi you can get away with a 5w handheld but something along the lines of a 15-25w mobile would probably be a better choice. I'm running an Alinco DR1200 that I bought used off eBay.

Any old TNC that supports KISS mode. Mine's an AEA PK-96, also from eBay. UI-View32 has all the "smarts" built in to the program so you can become an iGate, a RELAY, or a full WIDEN-n digi. Don't worry if you don't know what all that means yet, what's important is the capability is there when you need it.

I'm running 12 watts into a homemade discone mounted on a 6 foot mast on the roof. Not the most efficient setup but it works fine. Nearest digi is 38 miles away. J-poles work very well and are easy to build, so are 1/4 wave groundplane antennas. I've also used an old Ringo Ranger vertical.

Basically, if you have an old packet setup, that's what you need for APRS with the possible exception of a little more computing power. DosAPRS does run on old, slow DOS machines though if that's all you have available.

www.ui-view.com

Keep in mind that at this point, you cannot register the UI-View32 package (about $20 US). Roger is undergoing emergency cancer treatment and has not yet been able to make arrangements for someone else to do the registrations.

There is a freeware version called "UI-View" that you can download and try. It doesn't have all the features of the 32-bit version but from what I hear about it, it is just as stable.

If you do decide to use UI-View32, and the registration issue gets solved, plan on buying Precision Mapping from www.undertowsoftware.com (about $50) which will give you integrated, street level detail maps of the entire US. The next version of Precision Mapping is supposed to include Canada as well.

Get a TM-D700 by Kenwood. Great rig and all the data needs are built in. Get a high gain repeater type onmi and stick it as high as you can with really good coax/hardline.

Run about 25w if you are remote or adjust accordingly.

Bake in over at 250F for 14 mins let cool and enjoy!

1843. APRS and Handheld PC's

Yahoo group: APRS (1998 — 2006)
Date: 2004-07-27 17:29:40 UTC
From: Mike Sharp
Topic: 1843 Message: 1843

Hi gang,
I am looking for idea's how I can use APRS with my Ipaq handheld.
I already have a Pocket Tracker which interfaces with my Garmin Etrex
OK. I can also use the GPS fine with my TT3 and FT1500M if I want
more TX power.
What I want to do is use the Ipaq as a monitor with possibly a TNC
instead of having to take the laptop with me space is limited hence
the Ipaq idea. European cars don't seem to have much spare space.

Don-
>>2. this will be a FIXED STATION need antenna recommendation (OMNIDIRECTIONAL)<<

Try www.randl.com that's R and L Electronics. Small business but they've been straightforward, friendly, and competitive on price. They sell Ovek antennas under their own "Workman" brand. They've got a 8' tall coaxial colinear with something like 6db gain on 2m for about $70, at least 1/3 less than anyone else is selling the same or similar antenna for. There's a longer higher-gain version, and this is a 2m/70cm to boot. The antenna seems to work as well as any other brand, the construction seems reasonably good, too. There are the usual dissimilar metals on the mount and the radials, a smear of NeverSeize takes care of that for me.

Their web site is a bit primitive, so call the 800# and let them take care of you the old-fashioned way. Good folks.

Actually, you want to check out APRS/CE. PocketAPRS is for the PalmOS operating system, whereas APRS/CE is for the Windows CE operating system, which is what your iPAQ uses.

Hi guys,
Thanks for the pointers on the software , have downloaded APRSCe and found a source of some european maps.
All I need to do now is to get the radio(old ICOM IC2 Thumbwheel handheld),and Ipaq to talk to each other. My PicoPacket has just died (have had it since July 1996).Once I am happy with everything working I will register the software. Am already a registered user of Ui View 32.
Thanks for the first pointers

From: gkar1984
Topic: 1849 Message: 1849

I recently bought a used HandiPacket TNC online. I don't have a manual and so far I'm not having any luck communicating with it. Can some one tell me how to use the front panel reset switch and what the default comport settings should be.

I tried ordering a manual over a week ago and nothing so far. I didn't get a reply to my last e-mail either.

Thanks,
Mike kc9doa

From: Neil Lauritsen
Topic: 1849 Message: 1851

According to the manual to use the Reset switch to cause a hard reset.
1) Place the RESET Switch in the OFF position and turn the HandiPacket power switch off. Wait at least 30 seconds, then turn both switches on again.

2)The default settings are 1200 baud, 8 bit word length, no parity, 1 stop bit. (1200,8,N,1)

European Models use (1200,7,E,1)

3)The BAUD command used from the computer terminal is used to set the baud rate if something other than the default is wanted

The RS-232 switch must be on if connected to a computer or other I/O device

I have had to both replace the rechargeable batteries and
memory battery.
The unit works just fine

Can some one tell me how to use the front panel reset switch and what the default comport settings should be.

1853. APRS+ Icons & Live Update

Yahoo group: APRS (1998 — 2006)
Date: 2004-08-06 20:43:14 UTC
From: Harry KC5TRB
Topic: 1853 Message: 1853

I am having a bit of trouble with APRS+. On my desktop
I have turned "Enable Icons" and "Live Update" on, but
I can't seem to get them to work on my laptop. On the
laptop, the "Enable Icons" is an option, but it will
not turn on or give me the "Live Update" or "Map Update"
options. I don't know what I'm overlooking! I've reloaded
Street Atlas with a clean install and compared the laptop
with my desktop and still can't get it to work.

From: Rob
Topic: 1858 Message: 1858

I'm using PK232mbx with Winaprs. I got it to work. How do you get it to TX every ?? minutes. It will transmit with a F2.

After you get to work, can you use it with out the CPU. I would like to move to another location in the house. Set it up as a Digi?

thanks and 73

HWN Net Activation
The Hurricane Watch Net will be activating at 2:00 p.m. EDT for Tropical Cyclone Charley.
Present forecast calls for it to be a Category 1 Hurricane.

Hurricane nets have also been activated on IRLP,Echolink [Wx_TALK node 7203}
and eQSO [KC4QLP conference]. Reports from effected areas and ham operations
from the national hurricane center will also be on board.

Just convert it to a format that you can use.

Every copy of Office 2000 Pro has an optional program called
Photo Editor that is not normally installed - you have to go
into the setup program and manually select it to be installed.
It's in one of the later menus, after Word, Excel, Powerpoint, etc.
It's just one check box, and if you aren't looking for it you will
miss it.

Photo Editor can read and write the following formats:
.bmp
.jpg
.tiff
.gif
.png
.pcx

It may also be on earlier or later Office versions, or on
Office 2K Standard - I'm not sure.
I set up a bunch of computers for a local business and
he gave me a spare copy - still sealed - of Win 2K and
Office 2k.

So borrow a Office CD and have at it.

Be careful - the "Save As" dialog box has a "More" button.
Make sure you select it and set the "size" slider to 100%
for anything important. Note that the slider position is not
linear to file size. If it's not at 100% you can lose a lot of
detail. In some cases it doesn't matter, other cases
it does.

I found this out after my HP 3C flatbed scanner software
CD got misplaced and I had to download a driver from HP's
web site. The later version that you can download is less
capable and the conversion routines from the scanner's
native BMP format are hosed in the download copy and
HP won't fix it.

So I use PhotoEd to convert the BMPs to JPGs or GIFs, and at some point the slider got set to 50%. The reduced file size was great (200kb JPGs became 30k) when I was doing the mod article on the Moto Mitrek (www.repeater-builder.com, select Moto, then Mitrek then Interfacing), but when I was scanning maps and converting them they lost some important detail.

Go to the following site & download Irfanview:

http://www.irfanview.com/

It's one of the nicest graphics programs around & it's freeware for personal use. It'll do conversions on many formats. Don't forget to get the plugins also.

Subject: Florida Status

Gents, if I'm not on the net tonight, please pass this along to the rest of the gang. This is from Chet, AB4XK, Section Traffic Manager for the North Florida Section:

Ham radio/ARES is the PRIMARY means of contact and coordination in the Port Charlotte/Punta Gorda area. ALL landlines are down and cell towers within 30 miles either side of a line from Port Charlotte through Orlando to Jacksonville are down. Even the few satellite fone terminals in the area are jammed with FEMA and other National Agency traffic, making it virtually impossible to contact anyone inside the area.

There are a few welfare messages getting out. I was able to deliver one a Mr. Russell Cronin in Biloxi last night from his daughter in Sebring FL. As you can imagine, he was greatly relieved to hear from her.

Anyone with the time and minimum message-handling abilities is encouraged to monitor Florida traffic nets. DO NOT check in unless you can be of assistance in moving the traffic. They have enough "vultures" asking stupid questions about the situation as it is. (That's why I like CW in these situations HI!)

Packet/Internet interfaces are all down and there's no guess as to when these circuits might be restored to normal operation.

73, Jim KB5W

Topic: 1866 Message: 1866

Hi,

Sorry if this has been asked and answered already.

I was wondering if I could somehow use my cell phone's built in GPS receiver to feed a TNC/radio -- something like the TinyTracker?

Alternatively, can someone recommend the simplest (i.e., smallest, cheapest, easiest) environment to get started? I'd like to put this in my car.

Thanks,

Hi Don!

Any capacity for D700 radiograms? What about IRLP/Echolink? If we could get just ONE repeater working that had a IRLP or Echolink connect I am sure we could get some serious work done! Please let me know if you need a southwest contact. Check with your local Civil Air Patrol for additional resources, comms etc. That would help open up our HF net to you and message traffic handling etc.

There is an impromptu net on the Echolink WX_TALK server,node #7203 that is following the latest tropical systems and is standing by...and ready to help move health and welfare traffic into and out of the effected areas if any links/repeaters are lucky enough to be operational and can get on Echolink.

The impromptu net control is KD7YVV and is usually on all day.

1871. Are my antennas too close?

Yahoo group: APRS (1998 — 2006)
Date: 2004-08-18 18:03:43 UTC
From: n1xtk
Topic: 1871 Message: 1871

I have two seperate antennas for both a yaesu ft-857 and for my APRS setup on the top of the roof of my truck. The two antennas are only 2 feet or so away from each other. Every time the APRS system fires off a packet it wipes the signal off of the ft-857 when I am on 2 meters listening. I don't hear the BRAAAP noise, it just actually makes the receiver go silent. This is only at 5 watts. I would sometimes like to use 35 watts for the real desolate areas that I sometimes travel but am afraid to try that right now. Is there a way to mitigate this (i.e. notch filter) or some other way? Can this damage the receiver of the ft-857? Any help on this would be appreciated.

Very simply, you are just overloading the front-end of the 857.

Almost ANY RF that close to the radio will cause it to desense. The signal is so strong you would need a very good notch filter, but that would probably take out a large proportion of 2m as well.

In short, there aint a lot you can do about it!

Keith-
I would expect the extremely strong signal IS going to cause permanent
damage, the same way that an excessive SWR would. Same thing: SWR is high
strength signal coming in from the antenna, and it can blow things out,
right?

If you are using a TinyTrack or other APRS gear that is capable of turning
other equipment on/off, perhaps you could wire up a relay to your FT-857
antenna, to disconnect it for the two seconds it takes to surround the APRS
burst. Or, similarly, to cut power to your FT--857 during the APRS burst,
ensuring it is safe.

I have a similar situation, with a dedicated TM-221A/TinyTrak3/GPS Rx tracker intended for 24x7x365 operation, and a TM-V7A/KPC3+/GPS Rx doing FM voice/packet/GPS nav. Separate GPS antennas, and separate TM-221A/TM-V7A antennas (about 55" apart). All assembled and installed, but I'm not yet running the tracker. I guess the damage/desense risk would be a problem for BOTH radios, although we're only talking about 5-10W from the tracker.

It's easy enough to simply not allow them both to operate at the same time, but that defeats the purpose bigtime. Maybe I can disable the tracker Rx function somehow?

Then there's the 706MKIIG that will occasionally be doing 2m SSB with a halo. Oh, me!

I'm very interested in this thread, for obvious reasons. I'm sure there's an optimum solution/compromise.

Thanks for your info.

Good points. That may actually make a good test. If I was transmitting while the aprs system transmitted would I see my swr meter go off the scale? That would seem to be a definite indication that I may be in for trouble. I wasn't sure if the rf was actually strong enough that it was coming into the receiver and didn't even need the antenna. I may actually try this just to see if that is correct. The data burst is relatively short lived but long enough that I think I would get a reading on my swr meter. When I get a chance to try this I let the group know what I found out.

Any one else have an opinion?

Just for the record I am using a ft-10 yaesu ht with a TTII and a garmin 12xl gps and a dedicated 2 meter antenna. I have used this in various configurations over the years on another truck. Sometimes I have used it with a scavanged GPS out of a palm pilot. The 12xl is nice because it can use a remote antenna. I also have a 35 watt amplifier attached that I could use if I need but usually that is off. The only thing visible is a power wire and the 2 meter antenna wire and the patch antenna wire that goes under the seat and that is it.

I am loath to turn on the amp at this point until I am able to resolve this to my satisfaction though there are some areas that it is deparately needed.

1879. APRS use Dutchess County NY

Yahoo group: APRS (1998 — 2006)
Date: 2004-08-20 17:35:52 UTC
From: ronwcook
Topic: 1879 Message: 1879

Getting ready to build a TinyTrak to try APRS.

I started listening in to 144.39 in the Poughkeepsie, NY area and hear very little activity, usually 1 to 2 bursts an hr.

I notice that WA2YSM-15 is listed in MBARC club webpage under APRS but hasnt been active lately.

How can I get "heard" on vhf/uhf in this area?

How do I know there is a relay available here?

Thanks, RC

Sometimes it shows up on findu sometimes it doesn't. What is going on? Call Sign works fine. Seems funny sometimes it reads what I have put in and other times it reads: Status: TinyTrak3 v1.1.

Any thoughts?

David, one of the TT3 options is to send the status message every x-th transmission. You may hae it set to send every time, or once every third time, etc., and that would appear to be "sometimes" especially if every tx is not making it to the network.

I know findu was/is doing some work just recently to add a new backup server, that might make them intermittent right now. But if all of your transmissions aren't making the network, that's the simplest explanation for why they aren't all showing up. Unless you have have power, or are out in the quiet places (with high power<G>), there will be interference and other stations and dead zones. Often much more so than you'd think.

Keith-
I think the "right" way to check this out would be to disconnect your primary antenna cable, then use a meter to test the signal strength coming IN that cable when the APRS rig transmits. Probably a DVM to measure voltage? And then of course find out from the radio folks, how much reverse voltage the radio can safely tolerate on the antenna line.

Since the APRS burst may only be 1/2 second long, a DVM may not be fast enough and you may be better off using a 'scope or an analog meter with a fast response. I suspect the 'scope will be the only real accurate way, even an analog meter needs time to swing that needle.

Using the SWR meter, or even an 'antenna meter' may have the same problem, a 1/2 second burst may not give them time to really stabilize and show the signal strength accurately.

1883. Delorme Tripmate or Gps board not to much $

hi
well i dont know if it is off topics here but i am taking
the chance to post it!

i am looking for a gps unit ,this model: Delorme Tripmate

we are beginning our network here in Eastern Quebec ,me and some aprs
fans.
i heard that this unit is not to much $ and suppose to work great
is there someone maybe that would have one to sell?

or do you know a GPS board ,without the monitor screen
so it would be not costly

thanks in advance of your help!!!

Well, Keith,

I've pondered the question, and asked a selection of ham/EEs in the area.

Our collective conclusion is that one should actually Measure the voltage induced from one antenna to the other.

How?

If you have a handy Tektronix or other suitable oscilloscope (or a buddy who has one), you can put a 50 ohm non-inductive load on the feedline for one of the antennas in place of the radio, and measure the peak-to-peak voltage across the 50 ohm load when the other radio is transmitting.

If you don't have the handy VHF capable oscilloscope, your RF voltmeter (or RF probe with your VTVM or DVM) can also measure the voltage.

If you don't have the fancy test equipment, the switchable step attenuator (such as you might use for fox hunting) can be used with your radio to determine how much additional attenuation you have to switch in to get the S-meter to come back down to an on-scale reading; this will give you a measure of dB over your S9+whatever input, and we can then consult the manufacturer to confirm all is well.

We don't know what the transfer efficiency is between your two (assumed to be parallel) antennas is and if either or both of your antennas are gain antennas; measurement will resolve that for us.

Sorry to only offer a method instead of an answer,

Frederick/W9GOC

I have 2 GPS boards for sale $25 ea + shipping These are TTL level boards and will need a MAX-232 chip to bring them up to RS-232 level but they are otherwise standard. Paypal accepted and preferred

For sale Paypal prefered + actual shipping if needed. Cash on

delivery for local sale. No trades on these please.

Compaq Presario Laptop 333 Mhz Celeron 4 gig HD has Red Hat

Linux installed Works great for APRS, logging, general

computer use. 2 good batteries and power supply. $200

Alinco DR-1200 2 meter radio 25w out. $75.00

Shure 444 mic wired for Alinco/Kenwood $25.00

Yaesu Memorizer with radio shack mic. intermitent TX problem

$20.00

Radio Shack HTX-202 good shape has a battery that may or may

not charge. (trying this tonight on a universal charger)

Radio works off of top power jack and a friends 2AT battery

$50

Radio Shack Pro-66 50 channel scanner good condition $35

Motorola compatible RIB box with a couple of cables (MT-1000,

HT-1000) includes 9vdc wall PS $40

Gervais, I have a Tripmate in my truck that I have been running for over three years now with no problem. Did a self-start and power mod and it works great. Take a look at my page on the Tripmate:

http://www.ke4nyv.com/gpsstuff.htm

Only problem, not as easy to get now. SOMETIMES, you can find one on ebay, but they go for a premium because they are kind of rare now. My advice, get a Deluo, you can find them on ebay now for about $70. Comes in a little green tranlucent case almost the same size of a TinyTrak 3. Just requires a little modification to the connector and you're up and running. I'm hoping to get one soon and mount it up in front of my rear view mirror and get the Tripmate off of the dash.

Good luck,

1896. we need helping hand with APRSD

Yahoo group: APRS (1998 — 2006)
Date: 2004-08-25 13:42:37 UTC
From: gervais
Topic: 1896 Message: 1896

hi
with an help from an other ham we are trying to run APRSD here in my ilp machine
we have a bug actually and we are lost a bit

it's not sem to be so big but we need an expert that would help us

here some facts:

the sation:ve2rxy-9 is hearing what is going on the airwaves ,the rf traffics i mean.
when a station identify itself on the air,ve2rxy-9 is re-tx is transmission ONTHE AIR but not on the internet
if i go at the monitor of the pc that is hosting Aprsd i can see traffic from ex:the ve2ets server in Montreal,,,so we are receiving the traffic received BY ve2ets .

locally the station,ve2rxy-9 SHOULD retransmist all data comming from ve2ets on HIS TNC which is connected at the com2 ,,,it does not.

And all traffic that is hearing locally on the airwave is NOT relay at the ve2ets server.

it seems that the Internet and the com2 are not link together ,there is no tunnel between them if you like

is there someone that could help and take a look please,we need this Igate locally tpo conect our region to the Aprs network of the province

Thanks for your help

1897. Re: Are my antennas too close?

Yahoo group: APRS (1998 — 2006)
Date: 2004-08-26 15:40:31 UTC
From: Gene
Topic: 1871 Message: 1897

Either I am confused or there is a mis-comparison here. Received signal levels are in the microvolts where reflected transmit power (caused by hi-SWR) is in the WATTS levels, which causes excessive heating and problems in final amp devices. I admit I would expect that the recv signal in this configuration is high and would not be a good idea if running say FM voice or some other high duty cycle mode. With APRS the burst is so short that I suspect the amount of RF required to blow out a front end would not be developed with this setup. That is not to say that it could not, but I feel that it highly unlikely. It would be interesting to know exactly what the recv signal level is at the input to the -857 front end.

I base my above comments on my similar setup running 50W with APRS antenna appx 4 foot from a dual band 2M/440 antenna and a ATAS-100 screwdriver antenna, all three forming a triangle of sorts. I have had this setup for over 2 years and run all three radios (FT1500 APRS, TM-G707A and FT-100) at the same time with NO problems. I do get a little desense on the TM-G707A when on 2M when the APRS/FT1500 fires off. I will add that I usually don't have the FT-100 on 2M or 440, mostly HF and I get absolutely NO desense from the APRS transmissions on the FT-100 on HF.

Hi Gervais, I see you have a lot of ports closed as I cannot connect to your APRSd. (ve2rxy.homeip.net:14501)
Be sure to enable http port so that you and others can check the status. (To enable a port remove the '#' in front of the port line in aprsd.conf as shown below)

I see your connection to ve2ets is not sending any trafic (only 2K TX, 397K RX). http://montreal.aprs.net:14501/

If you have enabled a raw monitor port in aprsd.conf, you can telnet from a pc inside your network and see what the tnc is hearing.(port 14580 on my aprsd2.1.5)

However, once you enable the http your own status page will show a count if its sending any traffic. http://ve2rxy.homeip.net:14501

Also check your server connection setting to be sure its send & receive as below.

If these ports are enabled then you will need to look at your router to make sure port 14501 is open and fwding to your server.

You say your server is digipeating packets? In most cases an APRSd server should not act as a digi but as an Igate, just receiving local APRS packets and sending them down the internet. Rarely should it transmit anything other than its beacon.

Ron,
i have the version 2.1.4
i didnot install it,it was done by ve3tok,Bob.
i ask him to do it for me

try now to login now

tell me if it works

Hi Gervais, I see you have a lot of ports closed as I cannot connect
to your APRSd. (ve2rxy.homeip.net:14501)
Be sure to enable http port so that you and others can check the
status. (To enable a port remove the '#' in front of the port line in
aprsd.conf as shown below)

I see your connection to ve2ets is not sending any trafic (only 2K TX,
397K RX). http://montreal.aprs.net:14501/

If you have enabled a raw monitor port in aprsd.conf, you can telnet
from a pc inside your network and see what the tnc is hearing.(port
14580 on my aprsd2.1.5)

However, once you enable the http your own status page will show a
count if its sending any traffic. http://ve2rxy.homeip.net:14501

Also check your server connection setting to be sure its send &
receive as below.

If these ports are enabled then you will need to look at your router
to make sure port 14501 is open and fwding to your server.

You say your server is digipeating packets? In most cases an APRSd
server should not act as a digi but as an Igate, just receiving local
APRS packets and sending them down the internet. Rarely should it
transmit anything other than its beacon.

73, Ron

In aprsd.conf:
.
Server montreal.aprs.net 14580 server-sr
.
httpport 14501
rawtncport 14580

Don,

I have been using the Peet Brothers 2100 since July and love it. I have not yet incorporated into an APRS station but I am working on it and it seems quite straight forward.

From: ve1aic
Topic: 1896 Message: 1902

OK Gervais, I see some progress. Your http and telnet access is
working. If I telnet on port 23 I get your FBB BBS, which is good.
If I telnet to 1313 or 10151 I get an APRS connection but very little
local traffic. Is there much local APRS traffic?

When I connect to 10152 I should get some history traffic but I dont,
History Items 208 your status says there is some history.

I see a number of non-working server connections, suggest you make
only a couple active and use dns names instead of Ip addresses.

> Server montreal.aprs.net 14580 server-sr

When I connect to 10151 or 10152 I get the data stream coming in from
VE2ETS server so that is working well.

BTW the SSID of -9 is pretty well a standard for mobiles so you might
consider using another number for the server.

So most everything appears to be working and APRS clients can connect
to your server with UI-View and see the MTL data stream.

OK, I telnet to your tnc monitor port 14580 and don't see any traffic.
I'm not sure how the tnc is addressed in your version. Check
aprsd.conf and INIT.TNC files.

Here is mine for MFJ1270 in normal mode on com1 at 4800b.
tncport /dev/ttyS0
tncbaud 4800

GL,
Ron

Gervais I monitored your tnc port and also logged in with Ui-View on
1313 but saw only your own packets.

You may have either a serial port or tnc problem. The TNC shows it has
received something as the status page shows:
TNC Packets 362

Thats not very much traffic but perhaps there isn't much APRS activity
near you?

You can do the same thing to confirm your station is working right on
the RF side. I use telnet to 14580 all the time to check my radio side
of the server, just like being in parallel with the serial port.

1905. [AVIS-NOTICE] [APRS] Re: APRSD

Yahoo group: APRS (1998 — 2006)
Date: 2004-08-27 02:21:11 UTC
From: ve1aic
Topic: 1904 Message: 1905

Gervais, as mentioned there is a problem with your tnc/aprsd serial setup. Below is what I got from your monitor port and it shows the tnc dropping into cmd mode which usually means its not talking to the pc reliably. Perhaps its your server beacon text that it can't handle or too high baud rate.

Here is my beacon parm in aprsd.conf:

TncBeacon 15 !4605.00NI06313.57W& Charlottetown, PEI - aprsdYYG http://ve1uhf.no-ip.com:14501

Best not to go above 4800b for serial port. Even 2400b is fine if you don't have much RF traffic.

What tnc are you using? My INIT.TNC is stock and so is most of the aprsd.conf other that local info.

73, Ron

This was adressed in http://groups.yahoo.com/group/ui-view/ where
the latest version, 7.0, does not have the proper server. YET.
Untill Roger gets better or someone takes up the challenge you will
have to make due with Pmap ver 6 or earlier. There are ways of
grabing a static map, and displaying it if you don't need to zoom in
or out. Check that list for the latest.
Good Luck,
Steve

Date: 2004-08-29 21:26:03 UTC
From: walathan
Topic: 1910 Message: 1910

I'm trying to get the above combination to work. However, Kenwood gives no information whatsoever on how to use the TNC with a computer; it appears one can use the transceiver stand-alone, but perhaps not with a program. Has anyone gotten this combination to work? Or has anyone gotten this transceiver to send data to a PC terminal program? If so, could you please forward how you set the TNC options to do so.

Many thanks,

TIA,

Bill, AK5K

1911. wrong position coordinates continue to appear

From: jrskoler
Topic: 1912 Message: 1912

Hi,

Just got a Pocket Tracker and am experiencing some interesting things.

I'm in a very congested area for 144.39 traffic (NYC).

When I connect the PT to a rubber duck, I can hear it transmit (received on a local rig), and UI-View deciphers the packet (and the location info attached to it).

But, I don't seem to hit any digis.

When I connect it to an outdoor antenna (on a roof), I get listed on findu almost instantenously.

Here are a couple of raw packets (I'm using -8 and -9 with different digi paths, wa2jnf-15,wide7-7 and relay,wide7-7 respectively):

```
KC2YU-8>T0TR8X,WA2JNF-15*,WIDE7-7,qAo,KD1LY:`eW6l >/"4U}
KC2YU-9>T0TR8Y,KB2EAR-1*,WIDE7-6,qAR,KB2EAR-4:'eW6l >/"3r}
KC2YU-9>T0TR8Y,WA2JNF-15*,WIDE7-5,qAR,KB2ZE-2:'eW6l >/"3r}
KC2YU-9>T0TR8Y,WA2JNF-15*,WIDE7-7,qAo,K2PA:'eW6l >/"3r}
KC2YU-9>T0TR8Y,WA2JNF-15*,WIDE7-7,qAR,KB2EAR-4:'eW6l >/"3r}
KC2YU-9>T0TR8Y,KB2EAR-1*,WIDE7-3,qAR,KB2EAR-4:'eW6l >/"3r}
KC2YU-9>T0TR8Y,N1RHN-15*,WIDE7-3,qAR,K1LTJ:'eW6l >/"3r}

KC2YU-8>T0TR8Y,WA2JNF-15*,WIDE7-7,qAR,KB2EAR-4:'eW6l >/"3r}
KC2YU-8>T0TR8Y,N1RHN-15*,WIDE7-6,qAo,KD1LY:'eW6l >/"3r}
KC2YU-8>T0TR8Y,WA2JNF-15*,WIDE7-7,qAo,KD1LY:'eW6l >/"3r}
KC2YU-8>T0TR8Y,WA2JNF-15*,WIDE7-7,qAR,KB2EAR-4:'eW6l >/"3r}
KC2YU-8>T0TR8Y,KB2TSV-15*,WIDE7-1,qAR,N2AYK:'eW6l >/"3r}
```

I've looked, but I can't find a complete explanation for how to decipher these lines (i.e., what do each of the comma separate fields mean?).

I've tried it with an extending HT antenna and my packets get heard some of the time.

I'd like to figure out which digis are hearing me in different configurations. And, it would be nice to know what path the packet is taking to get to an inet gateway.

Lastly, if there is anything that I can do to make being heard more reliable while using the PT and a rubber duck, short of sending a beacon every 5 seconds, I'd appreciate hearing about it.

Thanks very much,

Joseph R. Skoler, kc2yu

If your being heard via findu then you have a igate in the area. Your not being heard part of the time might be from the fact that if your desense is not on then your TX over someone else and you have TX collision. If you do have it on there is the chance that your signal is being wiped out by a stronger or closer station to the igate. Your running the external antenna overcomes this. Your path is good and is being relayed, the commas are just to separate the calls. If you want to mail me direct and we can see what we can do if your still having problems.

Bill, Kenwood make good the YngGlitch ok maybe better than I speak Japanese. That manual should embarrass the hell out of anyone in any technical business. Remind me to win the lottery, buy the company, and have it rewritten to professional standards.<G>

You need to check the manual first, realize that they treat "packet" and "tnc" somewhat separately. Pressing the TNC button cycles through THREE modes, it is not an on/off switch. It is TNC, then Packet, then analog radio only. In TNC mode the built in TNC functions are used for APRS, and the data still goes out the PC port. In Packet mode, the radio does nothing about APRS. I haven't gotten any packet traffic strong enough to see if eiher the radio OR my computer can make heads or tails of it. But in Packet mode you are expected to be connected to a computer, and yes, Hyperterminal is enough. In Hyperterminal all you will see is the packet "welcome" message from the radio, if you turn on Packet mode after it is connected, followed by raw traffic or a command prompt (to command the radio). You are expected to run packet software to do aything more than that.

Cables...the manual breaks them out in the back. I usually solder up DB9's upside down and backwards unless I mark the specific pin numbers on them.<G> Won't damage anything, won't DO anything that way either.

A final gotcha is that the computer's COM port is expect to be set at 9600 when you are in packet mode--even if the radio has been set to 1200bps for APRS data and the GPS port was running at 4800bps for NMEA. Between automatic port configuration and the lack of it...just recheck for 9600 on the COM port before using packet with this radio. 4800 on the same port if you use a GPS on it. (Welcome to the dark side of serial communications.<G>)

Bill,

Ensure that you have a good antenna connected to the TH-D7 (not the one supplied with the unit). Although I only have anecdotal evidence, it appears that the TH-D7 does not pass data to the PC on poor signal levels - spent several hours hearing data but nothing appeared onscreen; changed the antenna & the setup (PC & HT) operated correctly with icons appearing on the map).

From: theplanters95@aol.com
Topic: 1926 Message: 1926

I am looking for information on voice over APRS or APRS over voice, however its called. When an APRS data stream is transmitted while using the voice mode on a non-APRS frequency. How is the APRS data stream picked up and put on the
internet when its used on a non-APRS frequency? -I've seen several articles in recent years referring to Search and Rescue and other disaster operations where the APRS data stream is part of a voice tactical net. But so far, I have not seen anything to describe how
they are getting the APRS information to the internet in order to be tracked by a site such as findu.com. -A recent bulletin came out concerning the Salvation Army Canteens supporting the hurricane disaster in Florida, and again after sending off an e-mail to that group, I found out they are using APRS on a tactical voice net. But I have
not heard back from them yet on how they get the data
stream into the internet.

The best way to do it would be to have the search and rescue people with Kenwood TH-D7A(G) hand helds and some D700's thrown into the mix. Run whatever 2 meter simplex frequency you want such as 146.460Mhz and set the Kenwoods to transmit position report after PTT is released. Run everything at 9600 Baud because the packet is really short and just makes a hissing sound for about 1/2 of a second. It would be something you could tolerate listening to where the 1200 baud packet burst after PTT would make everyone go insane after the first hour. There would need to be a portable digipeater built with a Kantronics KPC9612 with 2 radios hooked to it. This would be set at a high location above the search area and act both as a 9600 baud digipeater for the searchers, but also a gateway to the 1200 world of aprs where any home station out there is set to be an Igate can put everything on the internet. This also gives you ability to crossband and operate with people who may only have a 1200 baud aprs set up (tiny trak) This option would be VEEEERY expensive and somewhat complicated to build, but it would be reliable and effective. There are about 101 differant ways to accomplish what you would like to do, this is just one idea.

1928. Re: Voice with APRS

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-03 17:22:37 UTC
From: KC2MMi
Topic: 1926 Message: 1928

<I am looking for information on voice over APRS or APRS over voice>
Randy, what that's called is a misnomer.<G> Voice is voice, APRS is data, the two never co-exist. You can send APRS on any frequency you please, and it always gets into the internet the same way. Someone runs a receiver that is connected to a computer with APRS software that pipes the local RF data into the internet servers. The frequency doesn't matter, you could send it over cell phones or Barbie Walkie-Talkies, as long as one of them was plugged into that final receiver and computer. No magic there.
But the APRS data over the radio is sent as audio, like all packet radio. If there is any voice traffic, the packet is distorted an it will be thrown out without being decoded. So, running APRS on an active voice channel depends on sensing quiet on the channel, or sending the sqwauk often enough so that some signals make it to the receiver without getting stomped on by the voice traffic. Packets are lost, routinely, and the system largely relies on light traffic and random timing to make sure "enough" of them get through.

On VHF, 9600bps is not practical, 1200bps is used. On UHF, 9600 becomes possible but signal strength is such an issue that for ht's and "field" antennas you might be talking about only a mile or two effective range. Power means everything, packet simply does not decode unless it is perfectly intact--and 9600bps/UHF make that much less likely. In theory, the shorter packet length means less chance of being stomped. In practice, the signal is so much less likely to be decoded, that it doesn't happen. (At least around here.)

1929. APRS WX STATIONS

1930. Honoring Roger Barker's (G4IDE) contribution to APRS....

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-04 04:58:50 UTC
From: Dave Anderson
Topic: 1930 Message: 1930

September 4, 2004... For Immediate Release!

Last week, the Tier 2 SysOps posted a notice that they were forming a tribute called "UI-View Forever" to Roger Barker, G4IDE, the author of the UI-View APRS client software package. The Core APRS-IS SysOps also recognize the importance and sheer impact that UI-View has had on the APRS community. We applaud the efforts that the Tier 2 SysOps have made. This tribute could not be for a more worthy cause or purpose.

Since the best of amateur radio is always revealed in times of crisis or need, the Core group of SysOps have resolved to assist Roger as well. Taking a cue from the Tier 2 SysOps, we developed another approach to honor Roger's contribution to APRS, and specifically the APRS-Internet Service.

UI-View's importance extends past its functionality with Tier 2 and javAPRSSrvr-based servers. Therefore, the three APRS-IS Core SysOps have decided to offer a contribution based on UI-View connections to ALL APRS-IS servers. The contribution reflects connections to Core servers and any regional server identified on either of the two common APRS-IS server statistics websites (http://www.ahubswe.net/aprs_stat.asp and http://www.aprs-is.net/APRSServers.htm). We have taken a snapshot of all connections that occurred at 1730Z on September 4, 2004 and will donate one U.S. dollar for each UI-View connection that was observed. Note that since only the three Core SysOps performed the counting, and there are tens of servers, some of the counts may not have been taken at exactly 1730Z.

Here is what we observed:

Core Servers: 145 UI-View Connections
Tier 2 Servers: 252 UI-View Connections
Other Regional Servers: 153 UI-View Connections

The accumulated total was 550 UI-View connections to the APRS-IS. We rounded this value up to 600, compensating for any missed counts. The corresponding total amount of $600.00 will therefore be forwarded by the group of three Core APRS-IS SysOps to Roger and his family in their time of need.

We challenge ALL amateur operators to consider making some type of contribution to Roger and his family, however small. If it isn't possible to contribute directly, consider donating a few dollars to your local Cancer Support group. These groups provide invaluable services to families during times of need.

About the Core APRS-IS Servers

The center of all internet-based APRS data is passed through the three Core servers. We provide connectivity via servers running at large educational institutions and data centers having large bandwidth pipes in order to provide large-scale user access to this data. The Core servers offer data feed options ranging from downstream server access ingesting the entire world's real-time APRS data stream, to the end user needing specific data via a filtered port connection. We urge you to connect wherever you are able to get the best results. Should you decide to connect to the Core directly, we provide a round-robin next server rotation DNS system; all you need to use is rotate.aprs.net as your host and the port (10152 for the full world, 10154 for the continental US, and 14580 for a custom feed, just to name a few) of your choice.

Again, we are glad to be part of the global APRS-IS network, and wish all the best for Roger and his family.

For more information about APRS:

1933. Deleting all waypoints in GPS V?

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-09 01:45:09 UTC
From: fourchimney
Topic: 1933 Message: 1933

Hi All,

I set up my d700 to display waypoints and now I got too many! I've turned off that feature, but now I still have a zillion waypoints to get rid of on my Garmin GPS V. Does anyone know a method to delete all waypoints on that beast, instead of one-by-one? I couldn't find anything in the manual. I've got the MapSource software, but have found no solution there either.

Thanks,

Mike

1934. Troubleshooting Note and Deluo GPS Pro module

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-08 06:49:56 UTC
From: Bill P.
Topic: 1934 Message: 1934

Just because a gps works on the TT3 doesn't mean it will work on a TNC. Reasons, first, the baud rate but SECOND, the TNC can be wired as a DATA TERMINAL or as a DATA SET. What's the difference, pins 2 and 3, xmit data and rcv data. The TT3 is a one to one connection to the Deluo GPS and to the Magellen and Garmin while those units have pins 2 and 3 crossed if connected to the Kantronics KPC3. A null modem cable, pins 2 and 3 are cross over, is necessary.

4800 Baud is required for the TinyTrak 3. Watch out for the diagnostic programs, they jam the baud rate to 38KB. The auto baud detection in the Deluo will not return to 4800 unless the diag program is rerun and jam set back to 4800 baud.

I forgot what happened when the Deluo was used with the USB adapter on the laptop, maybe it stayed at 4800 baud.

The Garmin and maybe the Magellen, MUST BE SET TO NMEA 2.1

Most of my experience is with the Deluo GPS Pro using Serial to the TT3, USB to the laptop, and the special serial cable to the Compaq IPAQ 3635 with Delorme Street Maps for Hand Helds 2004, a real sweet heart setup.

Topic: 1935 Message: 1935

Hi all

I would like some help on setting up my mobile tracker. I have a kpc9612 setup with my gps and radio but could really do with some advice as to setting the TNC up. Being in the UK we tend to use trace instead of wide but how to get the system reporting is a bit of a mystery to me.

Any help is greatly appreciated.

Thanks

Jon

If it's anything like the III+, on your Waypoints menu, there should be a Delete All option, in addition to the Delete Waypoint option.

To delete all waypoints do: find, by name, then ok, menu, delete all
will be at the bottom of the menu.

1938. RE: Deleting all waypoints in GPS V?

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-09 17:06:51 UTC
From: KC2MMi
Topic: 1933 Message: 1938

Mike, most of the Garmins have a security "scram" setting built into them. Hold down the magic keys at power-up and you literally scram the reactor, it will do a full erase and factory reset on all the data in the unit. Collateral damage is that you lose any other waypoints, home location, GMT offset, etc, that you have.

Offhand it was something totally unlikely like holding down the lamp and something else during power-up...you'd have to check the manual for your model.

If you want to save things it might be easier to export all to the computer, then go into that file in a text editor and hack away, just sending back what you wanted instead of poking little buttons on the GPS.

Hi Joe.

As far as I know the use of a suffix on your call when you're in another area was simply to notify people where you were transmitting from. Considering APRS will tell everyone where you are, give or take 100 feet, the VE? suffix really isn't required. If you're concerned about it, I'd toss it into the comment of the occasional beacon as you suggested.

Joe, just operate per normal assuming you have "N7JEH-?" and mobile icon programmed in the "box". I've done the same in the States without problem. There's good coverage in these parts. Wide 3-3 will work well, and provide coverage into northern New York for sure. There are several I-gates which would provide linkage back to home base. Welcome to Hogtown and Canukville.

1944. Troubleshooting a Raystar 120 GPS

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-13 14:45:25 UTC
From: wbickle
Topic: 1944 Message: 1944

My apology if this is a bit off-topic, but few people seem to know more about GPS than this bunch, so here goes.

I just yanked a Raystar 120 GPS (NMEA output) off my boat. It was tied into a chartplotter, and the system was prone to intermittent losses of fix (no satellites found at all).

I replaced the GPS, and am suspicious of water intrusion. I'd like to bench test the unit, using a PC. How do I wire it up, what software do I need, etc.

Many thanks,

Bill

Most standard mapping applications (Delorme, Streets&Trips) will accept NMEA data and plot the location. Alos, connect it to a standard terminal program like Hyperterminal and see what it is spitting out.

1946. Tiny Track 3 setup with RELAY and WIDE2-2 questions...

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-11 14:36:12 UTC
From: wb6mlc
Topic: 1946 Message: 1946

Hi gang,

I am still learning how to properly configure my new TT3, and read in some APRS documentation about the RELAY parameter in the "digi path" field.

If one desires to be tracked when mobile , or when pedestrian mobile (hiking up a trail) , should "RELAY" be used along with WIDE2-2?
In these situations, the VHF tracking signal will not always be stong and in the clear to be heard. I

Check out the TinyTrakIII - www.byonics.com - it is not a full TNC (no receive capability) but for position reporting from a mobile where you don't need to decode incoming messages it will work fine.

hi blair
well thanks for the tip,
i think that we found what we need with the pocket tracker

i showed it to my fellow ham and they loved it,this is exactly what we need

73/s

merci encore,
gervais,ve2ckn

1956. Davis WX Interface??

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-23 15:27:45 UTC
From: hsvham
Topic: 1956 Message: 1956

Hi,
I am new to the group. I have searched the files/archives and do not find an answer to my question:

I want to build up a PIC-based interface between my Davis Vantage Pro weather station and an APRS radio, to be a standalone wx station for a solar-powered mountain-top location. Obviously, the interface (acting like a PC conected via the VP's WeatherLink datalogger) will have to periodically "ping" the VP for the latest data, and send that data via an on-board modem to the radio mic input for APRS transmission.

I see that the TAPR PIC-E board would be a suitable hardware plaform for my interface requirements, but my limited searches have failed to turn up any existing PIC code which I could drop into the PIC-E to implement the Davis/WeatherLink interface.

Has anybody seen any PIC code to do a Davis interface for a stand-alone APRS wx station?

73,
Steve Jones N4HF

1958. RE APRS via tmd700a

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-24 16:28:14 UTC
From: Grant
Topic: 1958 Message: 1958

The quest left to be answered is the PC going to be looking at info from the street pilot or the D700? the are several sites on the inter net that have wiring diagram to allow you to do either but not both at the same time out on the inter net look for "GPS wiring" or GPS to D700 and computer or something similar

You can make overlays in Precision Mapping 5 and 6 and then use those in UI-View32. You can also create UI-View32 overlays with just a simple text file in the specific format.

Don't know about any of the other APRS client programs. I used to use WinAPRS but have finally managed to purge that experience from my memory.....

1961. Re: [APRS] APRS via tmd700a

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-25 14:21:36 UTC
From: Phil Reed
Topic: 1954 Message: 1961

One of the problems you will run into is that the TM-D700A is actually designed as a stand-alone APRS machine. It doesn't need a laptop to run APRS -- you can do pretty much everything it's designed to do from the front panel. If you want to effectively use a laptop in APRS mode with the TM-D700A, you have to put the radio in TNC mode as opposed to APRS mode, and if you're going to do that you might as well have gotten yourself the Alinco radio with a built-in TNC.

I believe there is an undocumented command you can type to the radio (I *think* it's 'AI ON') that will cause the RS232 port to echo the GPS strings coming in from the GPS port, so at least you would be able to use mapping software on the laptop while continuing to use the APRS functions of the radio. I'll have to dig through my archives and see if I can confirm this though.

I am looking for a certain aprs website I used to use.

It interfaced with nice maps microsoft? and java -

It was like jfind or somthing like that. I know and use the others
findu, aprs.net aprsworld etc.

I liked the zoom in out better than most others.

ARghhh help!!

Thanks, David

I don't know as I use winaprs I can send you one and you can find out if
you want or I can upload one to the files section and you can check it
from there if you wish. Let me know which state and county you are in
and I can upload it in the morning.

1969. identification of a used gps board

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-30 00:35:44 UTC
From: gervais fillion
Topic: 1969 Message: 1969

hi
a friends of mine just gave me this board,he told me it is a Gps but not
much informations,is there someone that could help me on this
i am sending some photos that could help to identify it
i dont know if yahoogroups will let them pass trew the email
if not,if there an expert that could contact me identify it so i could apply
it
on my project

thanks

gervais,ve2ckn

1970. Re: [APRS] identification of a used gps board

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-30 07:38:53 UTC
From: Ronny Julian
Topic: 1969 Message: 1970

I have a pinout that could be "close" to what the 20 pin header is. You will want to check with this company and see if its one of their early models. The 8 pin phone jack may be the best thing. If this checks out to be a standard serial port with non TTL levels then you are set. Let me know your findings and if you find more boards.

I see you have an MMCX or SMB connector attached. Does that go to an active antenna off camera?

I tried to send this with attachments but Hotmail booted it back. I'll try uploading the files inside the Yahoo group.

Ronny,
send it at
ve2ckn@...

i made a phone call to my frends,he told me that it is from a car he baught
.
it was a system of satellite tracking he had with the car but didnot want it
activited
so it dismantle it and not knowing what to do he gave it to me

it was not in function anymore but the saler was saying it was a plus value
with the car ,,,,

he we dont have the same problem of steal car then in big city

1972. Weather Station Question

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-30 18:20:15 UTC
From: djs13
Topic: 1972 Message: 1972

When I browse FINDU.COM and associated sites, I often see stations labeled CW12345. THese weather stations do not appear to have any amateur strings showing from them. What type of stations are these? (Other than weather observation stations.) Who runs them? And do they use Amateur or other frequencies?

Dan Sullivan
KO1D
Falls Church, VA

1973. Re: Weather Station Question

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-30 19:02:16 UTC
From: David
Topic: 1972 Message: 1973

Dan,

"Citizen Weather" Stations can apply for call signs without being hams
and post their personal weather station data on APRS.

Dan,
also the Citizen Weather Stations do not broadcast on the amateur
bands. They post their weather data via a server it is then possible
to see it on findu.com

1975. WX Staion Digi

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-02 00:16:51 UTC
From: Dave
Topic: 1975 Message: 1975

Is it possible to have a wx staion act as a digi as well? A ham in my area is running a wx station on APRS using winaprs. If I can get the info to make him a relay digi it will fill a hole in Northeast Nebraska.

1976. Rig recommendation

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-02 00:17:52 UTC
From: jrskoler
Topic: 1976 Message: 1976

Hi,

I've been trying to make a pocket tracker work in NYC, but the 250mw just isn't strong enough for this rf- and tall-building-dense area.

I'm actually quite surprised at the lack of digipeaters in NYC -- looks like we've got a nice one in Brooklyn, one in Northern Manhattan (Columbia U. area), one in the Bronx. That's not a lot for this dense area.

So, I'd appreciate a recommendation for an inexpensive 2m rig that I can easily interface to a tinytrack. Something I can set up in the car and leave it run (figure I set the smartbeaconing on, so it only xmits position when my location/direction changes).

I was looking at the Yaesu FT-2800 (solid, inexpensive, I'm familiar with Yaesu's), but I notice it doesn't have a data jack.

Thanks very much,

Joseph R. Skoler, kc2yu

There are several alinco and Kenwood units that have a serial connection on the back for running APRS. Kenwood has a 2M rig that has it. Will do some checking for you.

1979. Re: Rig recommendation

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-02 22:44:51 UTC
From: jrskoler
Topic: 1976 Message: 1979

Thanks very much for the info.

I would have gone with the 1500, but it's discontinued.

Don't know anything about the Kenwoods.

I used to have an Alinco 605 and didn't like it one bit -- way too
much intermod, poor quality overall, imo.

I'm leaning towards the 2800 and tinytrack -- I believe it uses an RJ
type mic jack, so it should be easy enough to wire up for tx only.

From: Howard K4QB
Topic: 1976 Message: 1980

Try the new Icom 2200 it has rs-232 9 pin for computer.
I run th IC-2100 using mike input RJ45, also us an Icom IC-299 on APRS at home and mobile, use a PICO-packet II
by PacComm, it has dual input one for computer and one for GPS it is about the size of cigarette butts.
good luck

For $100 more you can get the FT-7800 and get a data jack and 70 cm.

<an inexpensive 2m rig that I
can easily interface to a tinytrack. ...but I notice it doesn't have a data
jack.>

Joe, the TT3 will interface with any radio that has a MIC, EAR, and PTT
connection. A "data" jack really isn't necessary and in fact is
misleading--the TT3 uses audio connections, it really isn't a "data" signal.

Here in NYC, even a 5W HT with a 1/4 wave magmount may need to be within 1/4
mile of a digi before it is received over the terrain and background noise.

I've used a 250mW PocketTrack into a 6+dbi gain antenna, and hit a digi from
that. The antenna counts as much as the radio power does.

But radios for the TT3? Heck, I've even used a 25-year old 1.5W Kenwood HT
for that. No "digital" sockets are needed, just try to find a cheap radio
with power, and a good antenna.

True I have mine attached to a Kenwood TK-240 with the radio and TT
mounted in the back of the side pocket near the fuel inertia cutout with
no problem. I thank everyone for the GPS ideas I got a hold of the eBay
seller that was listed and got one on the way.
Going to be fun having a tracker in the car for letting my better half
know where I am without having to ask! I run aprs at the house with a
Kenwood 2M rig attached to the laptop and KPC3.

I usually get them off of ebay. The following are
current auctions:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=73362&item=5723984550&rd=1&ssPageName=WDVW

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=73362&item=5723662374&rd=1&ssPageName=WDVW

No difference in the two, but you will need to get a
GPS antenna with an MCX connector for this board. I
have used several of these oncore modules with APRS,
they work great with the TinyTrak in TTL mode.

This antenna is prefect:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=73348&item=5723064661&rd=1

1987. SW Virginia APRS "Summit" Meeting

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-04 03:21:19 UTC
From: J. Rausch
Topic: 1987 Message: 1987

I'm not sure how many people from Virginia are on this list, but I am trying to get together a meeting of all of the APRS users in the SW area of Virginia. This is just an idea at this point, but I would like to get an idea of the interest in this and possibly get some help spreading the word.

The meeting doesn't nessecarily have to be limited to just the SW section of the state, I'm just not sure that people will want to drive 4+ hours from the other side of the state to attend. Prove me wrong if I am :o)

APRS: KE4NYV-15

1988. US Stations Operating APRS portable VA/VE/VY

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-04 11:52:22 UTC
From: Daniel Sullivan
Topic: 1988 Message: 1988

I sent a message to the RAC and got a very good reply from them on the portable APRS operations question I posted earlier on one of the groups. I thought since APRS operations over the VE/W border were very popular others would want to see the answer and the original email.

The original email:

To Whom It May Concern:

My name is Daniel Sullivan, KO1D, and I will be heading to Toronto on a trip next week. I will be operating APRS, 2m and 70cm Voice FM while on my trip. When operating voice I add the VE3 prefix as either a suffix or prefix to my call to designate my location. On APRS the software does not seem to support a digital version of this policy. Some of us have discussed a potential alternative I would like to get a comment on if possible.

Usually my APRS signs:

KO1D-2?? (the rest of the GPS Data, Status Message and other telemetry in the string here)

While in Canada would it be considered LEGAL to identify as:

KO1D-2?..(the GPS Data), VE3/KO1D or VE3-KO1D etc. as a status message(Then any other telemetry.)

For example:

KO1D-2>APRS,WX3P*,qAO,VE3GSI:!4401.80NN07904.50W#PHG4641/VE3-KO1D

Or something of this sort?

I apologize if this is all very confusing but from what others have informed me, as I am new to APRS, there were no provisions in the protocols used for extended licenses such as this situation requires.

Thank you for all your time and help in this matter.

Daniel Sullivan
KO1D
Falls Church, VA

The reply is from VE3IQ of the RAC.

Good evening Daniel:

I have discussed your question about identifying on APRS with Doug Leach, VE3XK, and I am replying to you as I am the RAC liaison on regulatory matters with Industry Canada (IC), our regulatory authority.

I am going to have to ask IC to rule on the APRS question. They will not be able to get me an answer before you are on your way to Canada, if I have read your message correctly. Of course, I cannot speak as the regulatory authority, but I suspect that if you identify on APRS in your normal fashion, IC would not be upset. You are identifying, and the identification is in a standard format, not encrypted, so I think there would be no problem until they get things sorted out.

We very much appreciate that you want to do the right thing.

On voice while you are in Canada, you should sign as KO1D portable (or mobile, as appropriate) VE3 if in Ontario. You use the call area in which you are travelling as part of the identification after your call sign.

As you know, Canada and the the US have a very special bilateral arrangement governing the use of radios in the other country's territory. The requirements for identification of radio stations, among other things, are enshrined in a Treaty dated 1952, at which time, of course, APRS and our new digital modes did not exist. Specifically, while in Canada, US amateurs must follow this procedure, which has been copied from the Treaty into our Radio Information Circular (RIC) 2:

9. Station Identification

1. The operator of an amateur station in Canada shall identify the station by transmitting the call sign assigned to that station.

2. The operator of an amateur station licensed by the Government of the United States shall identify the station:

(a) by transmitting the call sign assigned to the licensee's station by the Federal Communications Commission;

(b) if transmitting:

(i) by radiotelephony, by adding the word "mobile" or "portable", or

(ii) by radiotelegraphy, by adding an oblique character ("/"); and

(c) by adding the Canadian amateur call sign prefix set out in Column I of an item of Schedule IV for the geographical location of the station set out in Column II of that item.

3. The operator of any amateur station shall transmit the applicable identification referred to in subsection (1) or (2) in English or in French, at the beginning and at the end of each period of exchange of communication or test transmission, and at intervals of not more than 30 minutes throughout the period of exchange of communication.

Of course, Canadian amateurs travelling in the USA have to identify every 10 minutes per the FCC requirement.

I will ask IC to rule on your question and I will advise you. It is something to which we can all use an answer.

I hope you have a good trip to Canada and enjoy our autumn colours.

73,
Jim

Subject: SW Virginia APRS "Summit" Meeting

I'm not sure how many people from Virginia are on this list, but I am trying to get together a meeting of all of the APRS users in the SW area of Virginia. This is just an idea at this point, but I would like to get an idea of the interest in this and possibly get some help spreading the word.

The meeting doesn't nessecarily have to be limited to just the SW section of the state, I'm just not sure that people will want to drive 4+ hours from the other side of the state to attend. Prove me wrong if I am :o)

APRS: KE4NYV-15

Thanks,
Jason KE4NYV

From: "Daniel Sullivan" <djs13@...>
Subject: US Stations Operating APRS portable VA/VE/VY

I sent a message to the RAC and got a very good reply from them on the portable APRS operations question I posted earlier on one of the groups. I thought since APRS operations over the VE/W border were very popular others would want to see the answer and the original email.

The original email:

To Whom It May Concern:

My name is Daniel Sullivan, KO1D, and I will be heading to Toronto on a trip next week. I will be operating APRS, 2m and 70cm Voice FM while on my trip. When operating voice I add the VE3 prefix as either a suffix or prefix to my call to designate my location. On APRS the software does not seem to support a digital version of this policy. Some of us have discussed a potential alternative I would like to get a comment on if possible.

Usually my APRS signs:

KO1D-2?? (the rest of the GPS Data, Status Message and other telemetry in the string here)

While in Canada would it be considered LEGAL to identify as:

KO1D-2?..(the GPS Data), VE3/KO1D or VE3-KO1D etc. as a status message(Then any other telemetry.)

For example:

KO1D-2>APRS,WX3P*,qAO,VE3GSI:!4401.80NN07904.50W#PHG4641/VE3-KO1D

Or something of this sort?

I apologize if this is all very confusing but from what others have informed me, as I am new to APRS, there were no provisions in the protocols used for

extended licenses such as this situation requires.

Thank you for all your time and help in this matter.

Daniel Sullivan
KO1D
Falls Church, VA

The reply is from VE3IQ of the RAC.

Good evening Daniel:

I have discussed your question about identifying on APRS with Doug Leach, VE3XK, and I am replying to you as I am the RAC liaison on regulatory matters with Industry Canada (IC), our regulatory authority.

I am going to have to ask IC to rule on the APRS question. They will not be able to get me an answer before you are on your way to Canada, if I have read your message correctly. Of course, I cannot speak as the regulatory authority, but I suspect that if you identify on APRS in your normal fashion, IC would not be upset. You are identifying, and the identification is in a standard format, not encrypted, so I think there would be no problem until they get things sorted out.

We very much appreciate that you want to do the right thing.

On voice while you are in Canada, you should sign as KO1D portable (or mobile, as appropriate) VE3 if in Ontario. You use the call area in which you are travelling as part of the identification after your call sign.

As you know, Canada and the the US have a very special bilateral arrangement governing the use of radios in the other country's territory. The requirements for identification of radio stations, among other things, are enshrined in a Treaty dated 1952, at which time, of course, APRS and our new digital modes did not exist. Specifically, while in Canada, US amateurs must follow this procedure, which has been copied from the Treaty into our Radio Information Circular (RIC) 2:

9. Station Identification

1. The operator of an amateur station in Canada shall identify the station by transmitting the call sign assigned to that station.

2. The operator of an amateur station licensed by the Government of the United States shall identify the station:

(a) by transmitting the call sign assigned to the licensee's station by the Federal Communications Commission;

(b) if transmitting:

(i) by radiotelephony, by adding the word "mobile" or "portable", or

(ii) by radiotelegraphy, by adding an oblique character ("/"); and

(c) by adding the Canadian amateur call sign prefix set out in Column I of an item of Schedule IV for the geographical location of the station set out in Column II of that item.

3. The operator of any amateur station shall transmit the applicable identification referred to in subsection (1) or (2) in English or in French, at the beginning and at the end of each period of exchange of communication or test transmission, and at intervals of not more than 30 minutes throughout the period of exchange of communication.

Of course, Canadian amateurs travelling in the USA have to identify every 10 minutes per the FCC requirement.

I will ask IC to rule on your question and I will advise you. It is something to which we can all use an answer.

I hope you have a good trip to Canada and enjoy our autumn colours.

73,
Jim

1990. D-700 + Ui-View (digipeater Mode)

Yahoo group: APRS (1998 — 2006)
Date: 2004-09-30 11:57:36 UTC
From: sv3chf
Topic: 1990 Message: 1990

Greetings From Greece.....

I have a little problem with my setup and i'd like to know if
somebody has done it .

I want to run my D-700 as a Digipeater and not only as a Relay .
I've tried several trics and Tips but nothing happend .
A friend told me that D-700 is not capable for Digipeating and it
runs olny as a relay when you enable the digipeater mode on .

Well ?

Can I make it ?

Is there a stand alone setting for the d-700 or i can do it via Ui-
View ?

One way or anothere i'd like to know cause we got a serious problem
in my area and the station that use to Digipeat the signals has some
rx problems {QRMs)

Thanx for your time.....

Yes, it can be done □ our local club actually used one yesterday for this specific purpose (as a digi for □regular□ packet transmissions on 144.990), but I am not the owner of the radio, so I do not know the procedure to set this option up. (I was at one end of the connection.) I wanted to let you know that it can be done, though. And it works just the same as a regular digi □ you□d connect using the digi call as a VIA. (I.e., Connect SV3CHF V N9WYS)

If you wish, I can try to contact the guy who set this up, but I probably won□t have an answer today as to how he configured his station

Mark □ N9WYS

Look in the menu items under APRS and scroll through them and eventually you will see "Digipeater" Yes or No. I used it just last saturday with my car having D700 and my handheld D7 set to extremely low power inside a building of steel 2X4's and I could see it bing digipeated by the D700 ther were no other digipeater I could hear but the one 100 ft away in the parking lot. The handheld TH-D7G will not digipeat that may have been what your friend was thinking.

Yes, the D700 can be set up as a digipeater. The instructions are on page 27 of the Specialized Communications Instruction Manual. If you don't have one you can download a copy from the Kenwood website here:
http://www.kenwood.net/indexKenwood.cfm?do=ProductDetails&ProdID=5017&Group=5

Thanks for all thge great ideas, suggestions and explanations.

I figured the mic and speaker connections on the 2800 would be good
enough for the TT3, or most any TNC (that's how we did it in the
early days of packet (;-).

250mw into a mobile antenna just isn't doing the trick.

I'm familiar with the Yaesu line, so I'm leaning in that direction.

Now if only the xyl were actually interested in my whereabouts.... (;-
).

You should ask this on the D700 list. I recall someone documenting a bug in the D700 when used as a digi for APRS. Did something odd to the SSID, can't recall the details but the end result was "Don't do it...."

Just checked HRO: The IC-2100H is $164.99. Icom has a $20 rebate through 10/31/04, making net price $144.99.

Wow, that's a good price for a solid rig.

Works well for APRS using mike RJ45? Is there audio also on the RJ45 jack?

Very tempting....

(For anyone curious: Nope, no affiliation whatsoever with HRO, nor do I make any money whatsoever on anything however remotely related to ham radio.)

Gervais, by the time you screw around with ebay, wind up collecting all kinds of different scraps of obsolete boards, pay someone else for antennas, try to make it all fit....

Take the easy route. Buy a Garmin GPS18 from a discount source, and everything is complete and ready to go, including the watertight case around it all and a power consumption 1/2 that of any other GPS board.

Or, you can spend the same money for a DeLuo "bare" GPS, with or without antenna and probably without WAAS, for the same price with no case and twice the power consumption.

Sometimes, it pays to just buy it outright. If there's a group of you (100? 12?) ask the vendor for a group rate on the purchase, you should be able to save on shipping if nothing else.

The only real bargains in OEM boards are when you are buying in OEM quantity--like 100+ in an order, 500+ for a truly better price.

(Just one man's opinion.)

yes jared,
i will not go on ebay,,
i prefer another way of doing business but it is personnal.
yes since my question i have been able to make my mind,and my freinds
too,will go
on oem boards,i saw a kit in cdn dollars thats fit our need
oem boards,cables,antenna,,155$
bargain to what i can judge

we are seeing so much informations about Aprs that it is becoming confusing,
we must go,return,at the basic,what do want to do with it,what are our
needs?

for me it will be use in the house and on my atv vehicules,yes on an Honda
Fourtrax

bye for now

thanks for advise and opinion
we appreaciated it

Making a mountain out of a mole hill...

The links I sent for those OEM MOTOROLA 8 channel GPS boards, not obsolete junk, were only about $45 each. A patch antenna with the MCX connector is $18, I just bought one. The interface is nothing but a simple MAX232 IC. If you're using a TinyTrak or any device that can accept direct TTL you won't even need the MAX232, just feed the direct TTL in.

I'm not knocking what you said about Garmins and Deluos, I love them, I own 3 Garmins, a Deluo and a Delorme Tripmate. Hell, my company RPC Electronics was virtually built on making Garmin interface cables. I just like to see when someone gets excited about BUILDING somthing and putting it on the air. There is some real pride in knowing you put it together and made it work.

I'll step down off my soapbox now.

If you can find a Yaesu FT-1500 on ebay or such for a good price, I would say go that route unless you need a NEW rig. I run several FT-1500's in APRS service, both with TT3 and regular TNC and they are great. Built like a tank and never even get a bit warm even running APRS at 50w in remote areas.

Just my fraction of a dollar (i.e. $.02)

Just want to check one thing:

If power is removed from the rig and then re-applied after a moment, will it turn back on, without intervention, to where it was when it lost power (same freq., settings, etc.)?

Thanks very much.

Sorry, but I was referring to the 2100.

The reason I ask is because that Resume feature of the 1500 makes if
quite attractive.

2007. Re: Rig recommendation

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-05 23:33:23 UTC
From: KI6LO
Topic: 1976 Message: 2007

Joe,

Not sure about the 2100 but I built a 433 Mhz UHF relay control box (use a 2 button 'keyfob' like an electronic car door lock) for my APRS mobile setup using the TT3, Tripmate & FT-1500. I can remotely turn off the radio or the TT3/GPS or the whole shebang from inside the car as needed without stopping. System status is shown by LED mounted in front of the third brake light housing in rear window.

I setup the FT-1500 and LOCKED the pushbuttons to prevent changes. Power off and on without any problems.

Good Luck in your search,

I have used my D-700 as a digipeater for both "Relay & Wide" on
several occassions. As Dick stated in the Specialized Communications
manual page 27, or from the "APRS" menu go to "3-K which is the
Digipeater command page and select "on" then go to 3-L and enter
"wide". My D-700 can be "deaf" at times so make sure that the
squelch settings is not too high.
Let us know if this helps out!

First of all i want to thank all of you for your replies !
I cant open the http://www.kenwood.net/indexKenwood.cfm?
do=ProductDetails&ProdID=5017&Group=
Anyway i'll do whatever you propose and i'll let you know for the
results !
Does anyone know if i can run my D-700 WITH agw ?
i've tried but i haven't any success
If i could run AGW with D-700 then i cound be a digipeat with a new
tool that works with agw's program !!

Bill-
Sorry I haven't gottrn to reply to your query before this. Here is a url for Raymarine, the successor to Raytheon, where you can download a manual in PDF. It shows the cable connections that you'll need to bench test it.

http://www.raymarine.com/raymarine/Default.asp?site=1&SECTion=3&Page=168&Parent=166

The following assumes you have an NMEA version, I'm not familiar with the Seatalk version. Of course connect a 12 vdc supply to the proper wires and connect the NMEA output & data common leads to the proper rs232 pins on your PC. You can run a terminal progam such as hyperterminal, with the proper settings, usually 4800N1, to observe the output from the GPS.

I have a Raystar 100 gps sensor on my boat that feeds position data to my Raytheon depth plotter and I have it also feeding my Kenwood D700. Works fine.

From: jrskoler
Topic: 2013 Message: 2013

I've been reading, tickering, playing, etc., but I can't find a suitable solution for usefully tracking a stations path via the web.

Trying to set it up so anyone can go to a web site and see the path (crumbs, line, etc.) of where my tracker has been in the past 24 (48, 72) hours.

findu's tracking uses maps that cover far too big an area.

Perhaps the solution is to specify a geo file, but I don't know how/where to do that.

Perhaps there's another alternative.

Thanks very much for the help.

Findu's geofile concept is pretty easy to use. It let's you use any kind of gif or jpg file you want as a map. You could use satellite photos, topo maps, weather radar, etc. Unlike APRSWorld, you choose a map that exactly covers your normal hunting range. The instructions for using a geofile are at: http://www.findu.com/geo.html.

2016. Re: Web-based tracking?

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-09 15:43:15 UTC
From: jrskoler
Topic: 2013 Message: 2016

Thank you both for the reference to aprsworld's maps and findu's geo files.

APRS World's system is quite simple and provides a nice history of the raw data points. But, neither the map resolution nor the map center position is adjustable.

I;m trying to make findu's geo files work.

I took a gif file (1600 x 1600) that I use for ui-view (so I know the lat/long upper left and lower right) and made a .geo text file, as per the instructions (http://www.findu.com/geo.html).

When invoked by a findu cgi script, the map itself loads, but doesn't have any data on it.

It's at:

http://www.nycequities.com/maps/nycmap.geo

nycmap.gif is the gif file

I've tried:

http://www.findu.com/cgi-bin/track.cgi?call=kc2yu-9&start=48&length=48&zoom=1&xsize=800&ysize=600&line=0&geo=http%3A%2F%2Fwww.nycequities.com%2Fmaps%2Fnycmap.geo

and

http://www.findu.com/cgi-bin/plot.cgi?call=kc2yu-9&nocall=0&geo=http%3A%2F%2Fwww.nycequities.com%2Fmaps%2Fnycmap.geo&zoom=1&xsize=800&ysize=600&length=120

but no data showes up.

Did I do something wrong?

Thank you,

Joseph R. Skoler, kc2yu

For some reason my web browser thinks your .geo file is a binary file.
Try saving it as text.

From: jrskoler
Topic: 2013 Message: 2018

Odd, I thought I did.

Please try it now.

2019. DeLou GPS Mouse @ Compgeeks

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-09 15:55:14 UTC
From: KI6LO
Topic: 2019 Message: 2019

Just to let everyone know, there is another DeLou GPS Mouse listed on the Computer Geeks surplus page. The 'Geeks' website has lots of goodies for PC and consumers and occasionally they list GPS units.

I AM IN NO WAY CONNECTED TO COMPUTER GEEKS COMPANY. I AM JUST A SATIFIED AND REPEAT CUSTOMER WHO GET THEIR SPECIAL ANNOUNCEMENT EMAILS.

http://www.computergeeks.com/details.asp?invtid=10-014

This GPS mouse is a serial mouse and includes a serial to USB adapter. You WILL NEED to build an interface and supply 6Vdc max to the GPS unit to use it for APRS.

Gene KI6LO

2021. Re: Web-based tracking?

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-09 16:09:18 UTC
From: jrskoler
Topic: 2013 Message: 2021

I can go right to:

http://www.nycequities.com/maps/nycmap.geo

and it will display the contents of the text file.

Can't figure out why it's not plugging the position data into the map.

From: Roger Banks
Topic: 2013 Message: 2022

```
Here is your last position from posit.cgi:

40.71750 -73.98633 8.0 0.0

Here are your map tiepoints:

TIEPOINT 0 0 -74.218611 40.810833
TIEPOINT 1600 1600 -74.014167 40.739722

Your position is out of range for your tiepoints.

2023. Re: [APRS] Re: Web-based tracking?

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-09 16:38:13 UTC
From: Mike WA6ILQ
Topic: 2013 Message: 2023

While not quite relevant to the discussion, if you
put < and > characters around the URLs they
don't break when they word wrap.

At 08:43 AM 10/9/04, you wrote:

>http://www.findu.com/cgi-bin/track.cgi?call=kc2yu-
>9&start=48&length=48&zoom=1&xsize=800&ysize=600&line=0&geo=http%3A%2F%
>2Fwww.nycequities.com%2Fmaps%2Fnycmap.geo

With the arrows it looks like this:
<http://www.findu.com/cgi-bin/track.cgi?call=kc2yu-9&start=48&length=48&zoom=1&xsize=800&y
size=600&line=0&geo=http%3A%2F%2Fwww.nycequities.com%2Fmaps%2Fnycmap.geo>

>and
>
>http://www.findu.com/cgi-bin/plot.cgi?call=kc2yu-9&nocall=0&geo=http%
>3A%2F%2Fwww.nycequities.com%2Fmaps%
>2Fnycmap.geo&zoom=1&xsize=800&ysize=600&length=120

<http://www.findu.com/cgi-bin/plot.cgi?call=kc2yu-9&nocall=0&geo=http%3A%2F%2Fwww.nycequit
ies.com%2Fmaps%2Fnycmap.geo&zoom=1&xsize=800&ysize=600&length=120>

That little trick is part of the URL spec, but not everyone knows about
using them.
IE 5.5 and later follows the spec, I don't know about Netscape or
the others.

From: jrskoler
Topic: 2013 Message: 2025

I found at least one error: While converting from deg.min.sec to decimal, I didn't realize that 471 in the sec field meants 47.1 seconds. Doh.

Looking for a better way than terraserve and uiterra to get a local map (w/precide lat/long), to exactly my resolution and size specifications.

Thanks everyone!

2026. PLEASE trim your followups (was Re: Web-based tracking?)

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-09 18:01:52 UTC
From: Joe Simpson
Topic: 2026 Message: 2026

PLEASE, people, trim old text out of your followup messages. We really don't want to have to pick your new comments out of a message containing the entirety of the last ten messages in the thread including signatures. This is especially annoying for those of us subscribing in digest mode. Just include enough of the previous message to establish the context for your new comments.

Thanks.

Joe K4SAR

2027. MFJ1270C discontinued by MFJ

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-05 15:24:59 UTC
From: Ron Stordahl N5IN
Topic: 2027 Message: 2027

The latest MFJ 2005 catalog arrived and contains no TNC's! Earlier contact with them confirmed that they are discontinued.

I use one with UIView32 running JKISS firmware and I also have 12 of them at remote sites running UIDIGI.

With built-in DCD these are real workhorses..highly reliable for me.

If you can find a use one at a hamfest you may want to pick it up...they are going for nearly new prices now on eBay.

You can always run AGWPE and sound card for computer use, but the old TNC2 is still valuable for remote sites.

Ron, N5IN

2028. APRS Path Statement for New Hampshire

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-06 05:04:43 UTC
From: Jess Girard
Topic: 2028 Message: 2028

Hi All:

I have a Kenwood D700 plus a Radio Shack Digi-Traveler. I beacon APRS on 144.39 most of the time. I live in SW Connecticut and I'm accustomed to seeing my position show up on findu.com and aprsworld.com.

Our daughter and her family live in SE New Hampshire in Atkinson, about 15 miles north of the MA border (I think Haverhill or Methuen are the closest MA towns). When we travel to visit her my last position report is somewhere around Marlboro, MA and then nothing gets reported until I happen to travel to Maine. Even if I leave the rig running while the car remains parked (sometimes overnight!) I can't find any listing for my position while in NH.

I hear plenty of APRS stations on 144.39 while in the area, so I'm wondering whether New Hampshire APRS users have set up their path statements different from the way I do it, which is RELAY, WIDE, WIDE.

Does anyone have an idea about this?

Thanks
Jess ARS ND1L

2029. aprsd setup

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-06 22:45:22 UTC
From: Ted Maczulat
Topic: 2029 Message: 2029

We are setting up an aprs server for the local area.

there are only a couple aprs stations operating in this area on a regular basis but we have quite a bit of summertime traffic through this area.

we have successfully gotten the server running and forwarding heard stations on to the main servers.

we are also getting a data feed back from the server with all of the aprs traffic that appears to be world wide from the call signs in the data.

we really have no need for all this data being fed into our server and I am concerned about the bandwidth being used by this data stream.

is there a way to configure the server so that it will pass anything heard locally on to the main server and not get the huge data feed coming back???

Can someone provide some help in getting the setup tuned up???

Thanks...

2030. satellite aprs

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-07 13:10:38 UTC
From: svkaereste
Topic: 2030 Message: 2030

Dear Group,

Is anyone doing APRS through any of the satellites with LOW POWER? If so which bird, and what kind of power are you able to get it down to? What kind of hardware are you using?

I'm trying a VX2 plugged into 12V with a quarter wave verticle via the ISS. It should be about 1 1/2 watts. The GPS is the smallest Deluo available (GPS lite # 90-020) that I cut out of the "puck" and wired directly to a SMT tiny tracker glued to the bottom. It's all powered with the Yaesu cigarette adapter that I cut up to remove the circuit and hard wire to the 12v supply. I would like to eventually use this system while at sea aboard my boat. The entire unit is outside mounted in a tiny pelican box with only the antenna and 12v wire comming out.

Another question: Does anyone know if the "12v in" jack on the side of the VX2 is hot all the time?

OK to e-mail direct to JGalt54@...

Thanks to any who answer. I've used the APRS system off and on for a few years but think the equipment is FINALLY getting small and cheap enough to make dedicated trackers.

2034. RE: [APRS] satellite aprs

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-11 02:18:27 UTC
From: Dakota Summerhawk
Topic: 2030 Message: 2034

APRS had a sat up but it is now silent and when we get a better space program up again. There will be another sat for APRS. ISS is also going to get one but is sitting waiting for the same thing.
Dakota

Subject: [APRS] satellite aprs

Dear Group,

Is anyone doing APRS through any of the satellites with LOW POWER? If so which bird, and what kind of power are you able to get it down to? What kind of hardware are you using?

I'm trying a VX2 plugged into 12V with a quarter wave verticle via the ISS. It should be about 1 1/2 watts. The GPS is the smallest Deluo available (GPS lite # 90-020) that I cut out of the "puck" and wired directly to a SMT tiny tracker glued to the bottom. It's all powered with the Yaesu cigarette adapter that I cut up to remove the circuit and hard wire to the 12v supply. I would like to eventually use this system while at sea aboard my boat. The entire unit is outside mounted in a tiny pelican box with only the antenna and 12v wire comming out.

Another question: Does anyone know if the "12v in" jack on the side of the VX2 is hot all the time?

OK to e-mail direct to JGalt54@...

Thanks to any who answer. I've used the APRS system off and on for a few years but think the equipment is FINALLY getting small and cheap enough to make dedicated trackers.

Ron,

Could you go into a little detail about how to "use port 14580?"

I know what tcp ports are and how they're used by the protocol, but
how do I tell ui-view to use a particular port and why would using a
particular port make one-way traffic?

Thanks,

Joseph R. Skoler, kc2yu
joseph@...

From: ve1aic
Topic: 2029 Message: 2036

Hi Joseph,
Port 14580 is a user-defined port. When you connect to an aprs server that supports it, you can define what if any traffic to receive. (Without a filter command you can send aprs info but will not receive on this port)

Here is a link with the filter info:
http://www.aprsfl.net/filter.txt

For my Ui-View station I set its server connection to:
aprsfl.net:14580

Then in the box marked "Extra log-on text", I enter:
FILTER M/250

That filter command tells the server to send me only aprs packets that are within 250km of my location.
You can put whatever range value you want or use other range types as mentioned in the filter.txt document.

If you connect to a full-feed port like 10151 the server can overload your station and network connection with a ton of traffic from all over the world.

If there is a server in your area you might connect to it on 1313 to get a local feed.
Here is another link for APRS server info:
http://www.aprs-is.net/

73, Ron

Ron,

Fantastic info! Thanks so much.

I've implemented the connect to port 14580 as well as the m/250
filter.

I had been running a full feed. Didn't notice a slow down on the
cable modem, but maybe I'll notice a speed-up (;-)

Thanks Ron

Where in the aprsd.conf file would you put the filter command???

Would this work?
Server ontario.aprs2.net 14580 server-sr r/49/-124/200

Thanks...
Ted

2039. KPC-3 APRS configuration

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-13 14:59:18 UTC
From: stuckinthemud_org
Topic: 2039 Message: 2039

Does anyone know if the KPC-3 can be made to ignore beacons if they have already been digi'd by specific stations?

If not the KPC-3, can anything else be configured in this way?

I'm involved in setting up a closed system that involves getting beacons back to a single fixed point, so we want to make the routings one-way and prevent unnecessary multiple routing.

Jim, G1HUL

2040. what can be done to convert an KPC2 for Aprs

You can use a KPC 2 for a standalone if you are not going to use it as a full service Digi and you are fixed as you can put your Lat/Long in by hand. You will not have the UIdigi and the other new stuff but for a simple aprs station at home it will work.

Well bob,
first thanks for thes response.
one of the kpc2 would be used in my home with UIview
the other one fixed on my ATV vehicules with a gps
third one would be used as a digit in a city near me,so it would
relay what he heard at a Igate that we hope to setup

so if i read you as a Digi it would not work?but as a mobile
unit?

No- it will work as a simple digi it just won't be able to use any of the 8.3 version commands such as UIDigi,Trace etc. But it won't work mobile if you want to have a GPS plugged in it as it hasn't the necessary firm ware to support GPS. But you could ude it mobile but you would have to rewrite the unproto and beacon to insert the changing GPS statements and that would be a mega-hassle.
But I used a KPC 2 many years ago when whne I firts got into APRS in the early 1990's at my home QTH and it was adequate for awhile.
But I would be on the lookout for a KPC3 or a KPC3+ with firmware of 8.2 or higher.

Hello Group.

I was wondering if there was anybody that has APRS running in the tampa bay area though has there PC hooked to the internet that wouldnt mind me alowing me to send messages out from there locacion. Im in las Vegas and would like to send packets to friends in the area and would like to track people in your area. Im sure there is somebody doing it, just need to find someone ro do it with.

Thanks and you can also track whats going on here in Vegas though me.

Or maybe there is another way that somebody knows of.

Thanks

There is a Garmin GPS-35 which looks a lot like a computer mouse. No display. It works great for a tracker. There is an optional mag mount. It comes in 3 varities.

* GPS35-LVC Attached 10 foot power/data cable with bare wire ends. Accepts power from unregulated low voltage power supplies between 3.6 and 6 VDC. Asynchronous serial data interfaces via 2 serial ports with CMOS voltage level outputs, RS-232 polarity.*

* GPS35-LVS Attached 10 foot power/data cable with bare wire ends. Accepts power from unregulated low voltage power supplies between 3.6 and 6 VDC. Asynchronous serial data interfaces via 2 serial ports with true RS-232 voltage level outputs.*

* GPS35-HVS Attached 5 meter power/data cable with bare wire ends. Accepts power from unregulated high voltage power supplies between 6 and 40 VDC. Asynchronous serial data interfaces via 2 serial ports with true RS-232 voltage level outputs.*

* GPS35PC Attached 10 foot power/data cable with female DB-9 serial connection, ready to attach to your PC. Additional 8 foot power cable extension from the DB-9 connector terminates in a cigarette lighter plug for easy application of power supply voltage between 6 and 40 VDC. Asynchronous serial data interface via a single serial port with true RS-232 voltage level output.* **

the Garmin page is http://www.garmin.com/products/gps35/

Hope this helps

2050. Re: [APRS] GPS - Which ones have External Antenna

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-15 21:05:24 UTC
From: Warren Wheeler
Topic: 2047 Message: 2050

I found a site online that is selling them

I just googled a search for Garmin Gps-35 buy

came up with this link among others

http://safetracgps.com/gps35series.htm

hope it helps

[Non-text portions of this message have been removed]

2051. Garmin GPS 35

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-15 21:10:31 UTC
From: Warren Wheeler
Topic: 2051 Message: 2051

I should add that while the gps-35 does occasionally shows up on ebay, it's not normally on there. It's very much an OEM product. It's the kind of item that would be used in commerical tracking systems like On Star or vechicle theft tracking.

Thanks AGAIN! I guess I wasn't holding my mouth right or something. You have to get the search criteria JUST right. I was searching for GPS35 (without the -) and didn't find it.

The Garmin EMAP also has an external antenna connector, as well as a driven external antenna that works VERY well. I use it for APRS in my vehicle because it has a large LCD map display compared to the Etrex and many other GPS's for a lot less money than some of the more expensive GPS's.

From: SP3LYR
Topic: 2045 Message: 2060

If you are connected to servers with javAPRSFilter and port 14580, you have to use at least one filter to receive data. Each filter is like openning of stream. The common one is m filter, something like m/100 which gives you data of stations in the range of 100 km of you position. In APRS Server Setup put for Extra log-on text:
filter m/100
More info http://www.aprsca.net/filter.txt

>What am doing wrong ???? KP4VQ

You might want to post the question on tye ui-view yahoo group.
However, a check of any filter settings might be a good idea.
Also, hit F1, select Index and select some suitable item.

Stations that you receive via RF are showing?

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-18 18:31:17 UTC
From: J. Rausch
Topic: 2065 Message: 2069

Kerry, the TNC must be a TNC2 clone and then you can use the UI-Digi EEPROM. My suggestion is, if you have some room, use a cheap 386 computer and use Digi_Ned. This will make it very easy to update the firmware settings, instead of having to re-burn an EEPROM everytime. I use Digi_Ned with an old 386 laptop on my digi and it works great.

If you need somthing temporary that doens't require all of the "smart digi" features, the Tiny alone should do WIDE digi'ing with WIDE in the MY ALIAS parameter. This isn't always ideal but a way to get it on the air. Set, your UNPROTO to APRS VIA WIDE,WIDE or just WIDE, depending on your area.

Good luck,
Jason KE4NYV

Date: 2004-10-18 20:11:25 UTC
From: Ron Tonneson
Topic: 2065 Message: 2070

I think there is a misunderstanding here. The KPC3 firmware will not work in the Tiny-2. The Tiny-2 is a TNC-2 clone from Paccomm that uses a Z80 processor, the KPC-3 from Kantronics uses an 68HC11 processor.

Date: 2004-10-18 23:34:23 UTC
From: gervais
Topic: 2071 Message: 2071

hi all
i have this hand gps from TrimbleNavigation.
it seems that his name is ENSIGNGPS Model 17319
it is yellow and black ,have a display BUT no data output jack.
i am looking for the shematic if i may solder a connector to it
so it could be used on APRS
Before opening it i prefer to have some information.
i have the owner manual but there is nothing about the board inside

2074. GPS & Computer Interface with TNC

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-18 21:46:42 UTC
From: Kim Wells
Topic: 2074 Message: 2074

Hello to the Group,

I want to interface a Garmin 276c GPS receiver, a laptop and a Kantronics KPC 3+ TNC (and radio) so that I can auto-position report, send / receiver packet msgs and have a moving map on a laptop.

Is this Possible? What is the best way to do so?

73,
Kim, K3OCM
Ocean City, MD

2075. Re: [APRS] GPS & Computer Interface with TNC

From: Bob Bailey
Topic: 2074 Message: 2075

While I don't know the specifics of the Garmin you are using you have 2 ways to go possibly. The first way and probably they way you won't want to go is if you laptop has 2 serial ports you can plug the KPC3 in one and the GPS in the other however that will leave you with the fact you must use your laptop at al times while moving and most people don't choose this method.

The other is on the KPC3 DB9 connection one of the pins is for the GPS to go to and you will have to read the KPC manual to find out the setting that will allow the GPS to use that pin at the same time and your GPS may need an initiation toggle that the KPC can do if needed. There is probably someone on APRS locally that has this configuration that can help you further. But this is a start.

2076. satellite APRS

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-19 12:49:18 UTC
From: svkaereste
Topic: 2076 Message: 2076

Dear Group,

If anyone is interested, I just "pinged" the APRS system through PCSAT with 3 watts and an old mag mount 5/8 wave antenna, with no ground plain, inside my aluminum sided house. The antenna was bent into an arc to fit the frame of a window. In other words, not exactly an optimum setup.

Today I'm trying the ISS with 1/2 watt and the same hardware set up. Simultaneously I'm also trying 1 watt to a car top 1/4 wave antenna.

That sounds interesting. I'm running UI-VIEW and have never received a confirmation from any ping that I have tried. Even stations close by do not respond to my pings. Does anyone have any ideas on what settings may be wrong in my UI-VIEW32.....thanks

2078. APRS with ISS success

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-19 21:37:47 UTC
From: svkaereste
Topic: 2078 Message: 2078

Dear Group,

Success with 1/2 watt and 5/8 wave car antenna (with no ground plain) indoors "pinging" the ISS for an APRS hit! See: K2QY-15 on findu. I guess I'm going to try 1/4 watt tommorrow. I'd bet with the correct frequency it could be hit with a Pocket Tracker with a cat's whisker antenna for 2m. MMMM...

2079. Suggestions please on a dedicated GPS unit...

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-20 05:08:51 UTC
From: Mike WA6ILQ
Topic: 2047 Message: 2079

A friend of mine has 958,300 miles on his Suburban and
it's time for (another) paint job...
He asked me to make this posting...

His next project is adding APRS to the vehicle and wants
to permanently mount a dedicated GPS for that. The local
PD has hockey-puck antennas on the left edges of their
trunk lids, but he has no idea what those antennas are
feeding (the PD radios are Moto Spectras).

He's looking for a no-display serial-only unit, and is open
to discussion of any brand. A friend has a Garmin 18 on
a home-brew bracket up above the rear view mirror but
it only sees half the sky (shadowed by the roof). When
he asked me to post, I commented on the recent
discussion of the units with external antennas. That
discussion focused on the GPS units, not the
weatherproof antennas, however.

The suburban has three NMO mounts (3/4" hole) in the
roof right now (Kenwood 741 with 6m, 2m and 440) and
is amenable to replacing the front mount (to the point of
enlarging the hole and running additional cables) with a
"combo" high band and GPS. Or even mounting a
weatherproof GPS-only antenna in it's own (new) hole
(something like a OnStar antenna above the driver's
head).

Ann suggestions are welcome...

Whatever GPS is chosen does not need a display - it
will be feeding a Y-cable with one side going to a laptop
and the other side to a Tiny-Track feeding a dedicated
2m radio.

Mike WA6ILQ

From: bjarnebergum
Topic: 2081 Message: 2081

What will be the best setup for search and rescue opperation?

http://web.usna.navy.mil/~bruninga/mim22.html and a portable radio.

This one has abillity to transmitt Temprature outside and battery
power on the user + + + (but that's not nessisary...)
But this one has a Tinytrack 3 innside a dedicated radio:

http://www.byonics.com/pockettracker/

Can anyone tell me what to choose?

I am going to use a Yellow Etrex as GPS.

>
>I am going to use a Yellow Etrex as GPS.

I take it that the yellow etrex has a cable connection.
In 2001, the scout association in Norway tested S&R during its national jamboree, using emaps and Kenwood TH-D7s. This is an easy setup, and we think the test went very well (happily enough, there were no real s&r cases). But with a GPS without maps (like the yellow etrex or the ones you were linking to), each person will not be able to see her own and other personnel's positions on the GPS screen along with the map details - because the map isn't there. So a map GPS would be better.

Of course, if only the communication centre is supposed to have the personnel visible on a map, it's ok with any of the mentioned solutions, including the GPS+TH-D7 method (where you also can have 70 cm voice traffic while the tracking system is running on 2 m)

I suggest that he look into the Garmin GPS-35. It is about the size and shape of a computer mouse and fits your description to a tee. They have several versions to choose from plus several choices of mounts.When

I save up my $$, I am planning to buy one for myself.

One site that I was referred to that have them for sale at a reasonable price is as follows: http://safetracgps.com/gps35series.htm

The Garmin GPS18 is a low cost hockey puck with a built in
magnet and provisions for a mounting screw. It is at least
weather resistant, rated as waterproof to 1 meter for 30 min.

I have mine inside on the dash and it is working fine with less
than a full view of the sky. Of course I'm using it in a small
town and rural environment and that probably helps. It seems to
be popular with the Yahoo Tiny Track group.

OK. Any of them would do.
I found the TH-D7+(any)GPS with NMEA output is a good solution.
You'd have to purchase a better antenna than the rubber dummyload,
though (Permo has them; buy them when you buy your TH-D7). The
additional voice communication possibility without interfering with the
tracking is a good bonus. (I take it for given that the folks in the
field are allowed to transmit on ham frequencies. Else you'll have to
use a radio which unlicensed personnel are allowed to use.)

Yes. Great kit, easy assembly. Fantastic support. Works as good/bad as any other 250mW unit will, very dependent on antenna and local background noise, terrain, etc.

Supported "here" on the TinyTrack group on Yahoo.

> 4:`eUOl!">/"4D}
```

Lets break it down part by part:

KC2YU-9>T0TP3V,KB2EAR-1*,WIDE3-2,qAR,KB2EAR-4:`eUOl!">/"4D}

KC2YU-9 : Obviuosly your callsign

> : Seperator

TOTP3V : See below...

This field is the Destination callsign field. In the MIC-E binary format the longitude is formatted with the binary formula used in MIC-E and placed in the destination callsign field. This is used to shorten the packet's length and reuse the dest callsign.

KB2EAR-1*, WIDE3-2 : your current path for that particular packet.

The path can change as it travels through the network with SmartDigis that place their callsigns in place of a generic RELAY, WIDE or TRACE

qAR : this is the APRS Server designation. You will only see this if your packet makes it through an iGate. You will also only see this if the packet is extracted from the sever such as a raw internet dump in any APRS client or on findu.com

KB2EAR-4 : The rest of the path

: Position seperator

`eUOl!">/"4D} : This contains latitude, speed, icon and any other additional data.

Hope that clears it up some for you. I'm sure I missed somthing.

2097. Re: Format explained

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-22 10:41:44 UTC
From: jrskoler
Topic: 2094 Message: 2097

Thank you all for the explanation and the tapr link.

Is the following understanding correct:

20041021215637: timestamp

KC2YU-9>: my ssid

T0TP3V: destination field which is mic-e encoded latitude as well as a west/east indicator and longitude offset indicator and the aprs digipeater path (copied from the aprs spec) and the aprs software indicator (??)

KB2EAR-1*,WIDE3-2,qAR,KB2EAR-4: Still don't know how to decode this -- can we tell what path the packet took (i.e., which ssid first heard the packet, etc.) from this?

mic-e encoded information: `eUOl!">/"4D}

Thanks!

Yep.

> KC2YU-9>: my ssid

I think you're getting two things confused. KC2YU is
your call, the -9 is the SSID

> T0TP3V: destination field which is mic-e encoded
> latitude as well as
> a west/east indicator and longitude offset indicator
> and the aprs
> digipeater path (copied from the aprs spec) and the

Yep

>
> KB2EAR-1*,WIDE3-2,qAR,KB2EAR-4: Still don't know
> how to decode this -
> - can we tell what path the packet took (i.e., which
> ssid first heard
> the packet, etc.) from this?

You're not really going to "decode" it persay. Its
more of a parse-in method. First off, if its an on
air receive, take out the qAR for the server mark,
that leaves you with the full path:

KB2EAR-1*,WIDE3-2,KB2EAR-4

Here we can see what digipeaters this packet's path
took. Also, did you use a generic path such as
RELAY,WIDE3-3, WIDE ? Thats about the only way I can
see you getting this path, unless you manually put in
the KB3EAR-2 and KB2EAR-4. Typically the WIDE3-2
would be found on the end of the path such as
RELAY,WIDE,WIDE3-2
If it's not like that, I would suggest changing it.
Assuming we're talking about a packet from your
tracker.

> mic-e encoded information: `eUOl!">/"4D}

Yep
```

> Thanks!

No problem.

A typo on my part -- one of the few things I am indeed clear on is
the diff bet the callsign and ssid (;-)

> > T0TP3V: destination field which is mic-e encoded

It was an on-air receive. Why take out the qAR?

> KB2EAR-1*,WIDE3-2,KB2EAR-4

It's currently set to RELAY,WIDE3-3

Should I stick a WIDE in the middle?

Does the above mean that the station first hearing my packet was kb2ear-1? Can we tell what happened to the packet then?

Thanks again!

2103. Dedicated GPS unit. Deluo GPS Pro

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-23 06:14:34 UTC
From: Bill P.
Topic: 2047 Message: 2103

I've been using a Deluo GPS Pro hockey puck receiver into a TinyTrak III and a Compaq IPAQ 3635 PDA running Delorme Street Maps 2005 for Hand Helds. see www.deluoelectronics.com

At first it was a frustrating experience when the baud rate kept changing from 4800 to 38KB but now I know how to control it, simply don't use the diagnostic programs.

Building your own set of serial cables is touchy when working with DIN male and female connectors. Be aware that some folks number the pins in a circle while others number the pins in a horizontal fashion.

The Deluo GPS Pro requires 5 volts, period! Current drain is around 125 Ma. A 78L05 regulator is too small, a 7805 is required but of course it consumes some power too. I understand there are better regulators available.

Apparently some GPS receivers must have the equivelant of DTR held high to show that the terminal is powered on or the serial data will not stream. The Deluo doesn't care and constantly streams data.

Currently the Deluo is working with the IPAQ and TT3 for about 2 months. I use 10 2 amp AA cells to power the Deluo, the TT3 and an old IC2AT. A DC relay control board applies power to the HT only when needed so these batteries will run for many hours, in fact I'm passed 5 hours on new batteries.

Summary: Look for a GPS receiver that operates directly from 12VDC; defaults to WAAS on; Streams data without any control signals; is available in serial with USB adapters for the laptop; don't expect very good technical support.

From: n8miq1@aol.com
Topic: 1616 Message: 2104

I recently began playing with this program. There is not much documentation noted, so I have been just plugging away at it. I did find the pdf document from WA8MLF, which has helped. I am running the program with SA version 5. Issues I am having is that the map displays big red squares and little yellow ones for the stations instead of the normal aprs icons. Also, I can't seem to get the map to load automatically, as well as not updating the stations. Any suggestions will be appreciated.

From: aprswatcher
Topic: 1616 Message: 2105

Greetings Karl, there has never been much documentation or help with APRS+SA.
I'll see if I can help you with 2 of your problems:
To change the "Big Red Squares" below the main menu bar at the top of the page the one with "File, Edit, View, Setup..." go to the next menu bar containing "Maps, Tracked, Custom, Wx"
Left click on the "Maps" don't click in the area of the "drop down arrow" make sure you are left of it.
When you left click on "Maps" this will bring up a second menu containing 5 new menus.
Select the "Symbols & Text" tab, top left is "Symbols" with a "drop down box" for size select and color, select the new size you want, I use "very small" and "red".
Below this is "Text -size & color" I use "medium & red" and below this is "Track Lines- width & style" I use "thin & solid"
When your done with this page click "OK".
To "Enable Icons" go back to the same "Maps" menu and this time click on the "drop down box" and hover the mouse pointer over "Views" this should highlight it, and a second menu should appear, Left click on "Enable Icons", this will show each station with its respective icon on the maps.
Hope this helps you out,
73, Rex, KIØBJ
SouthCentral/SouthEast Montana APRS Gateway (HF), digi, mobile, Portable and WXTrak.

No, did you check the web-site?

http://xoomer.virgilio.it/msavegna/uidigi-e.htm

There is a Yahoo group too, that might have the info you need.

http://login.yahoo.com/config/login?.intl=us&.src=ygrp&.done=http://groups.yahoo.com%2Fgroup%2Fuidigi%2Fjoin

Without going through all of the documentation, it sounded like
some of the information can be changed by the sysop either from
the radio port or serial port. I know it is a popular firmware
in southern WI and that is about all I know about it.

2113. Re: [APRS] UIDIGI Source of EPROMS

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-26 08:54:12 UTC
From: Ronny Julian
Topic: 2109 Message: 2113

We have a burner at work but use a different type of chip for our devices. It should work if I remove the square adaptor. Anyone know a source for EPROMS and is there a difference in EPROMS used by the different brands of TNC2 clones?

I have 2 MFJ 1270Bs. One is going back to MFJ for a retune since it was a ROSE switch and it seems some hardware mods were made on it. I may want to just buy a tube full of the EPROMS if they are cheap enough and make a few copies in the case of hardware failure. I'll join the UIVIEW group as well later today. Thanks!

hi jim
well since my post i have been able to start ui-view ,baycom,,,,,finished at
01.27 in the morning,
now i must find the settings,,wide-wide or relay-wide
that is good for use around here

i dont know exactly what to write and setup

i am far from other digit or user,we will be used,when it will be confirgure
as a Igate for my region here.
any suggestion ?

bye for now

Kerry, I communicate with our local UI-DIGI digipeater from my home station on 144.39. I check and change parameters. Sometimes I bring the 1270B & the radio to the shack and do it using the computer (I don't have a laptop). I notice that if I change parms, sometime later they revert to back to their 'burned in' state. I don't know why, perhaps it's after a power failure. Maybe someone can jump in here and clarify that. I have several files I can send you that will be of help. One especially lists all the parms and there ranges. It is an XLS spreadsheet. Let me know if you would like it.

Glenn, I could use it as well. I've got a 1270 B and a single channel
radio ready to go.

Thanks!

Ronny here is a link to the set up as we are using in North Alabama on our systems. Tim N8DEU has done lots of work with all of us to get a good system. I run mine as N4BK-7 and also run the home station N4BK and a dedicated weather station N4BK-5. You can change the parms either locally or over the air but most of us run it with the back-up battery disconnected which is why it reverts back after a power failure. Saves trips to remote sites! You really need to join the UIDIGI Group sure helped me out when I first got started.

I joined it but have had no time to start reading.

Link was no good at this time. I'll check it later. I have an ARES meeting tonight.

Do you know anyone that can retune a MFJ 1270B and maybe even install and set up a Digi chip for me? I'd trade some 12 channel GPS boards for their time and labor.

Thanks!

Ya I saw that after I posted it so here is a link to the current file
I am using. I can program eproms for you no problem you need to edit
the file as you want it and then email it to me at n4bk@... and
I can send you a burnt eprom. Simple to install in the TNC.

2122. Shared Node with APRS, how?

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-26 21:08:02 UTC
From: Paul Luggar
Topic: 2122 Message: 2122

Hi all, I have the chance to set up an APRS digi if I can make aprs work with an existing packet node. I have no idea how to do this other then I know I will need two radios and a PC to run the APRS side of things. (Or a TNC that will digi APRS packets after being set up with a PC)
Here in the UK APRS frequency is 144.800 and packet 144.950 so to try and mix both signals would not work, they would have to be timed, ie. one or the other. The packet node is quiet most of the time which is the good bit for me, I think.
If anybody "knows" how to do this please let me know!
Thanks and 73
Paul.

Rex,

Tnks for getting back to me on this. You were the only one that responded, so I am wondering if others gave up because of the lack of documentation. Any one else care to weigh in on the issue? Seems like a good program if I can get it to work. I don't want to register if I can't use it.

I was able to get to the menu to change the size and color of the squares. However, I could not seem to find the icon menu you spoke of. I wonder if you are running a different version. Mine is 4.0.03.

For some Help documentation try a "Google" search of "ve5dgd" this is Dave Dunsters site, it has some info but has not been updated recently.
Haven't heard of the version that you are running the most current is v 2.24, you can recheck your version by going to the top menu bar ie. "File, Edit, View, Setup, Points..." the very last one on the right is "About" click on it and the very first line is the current version, should read something like
"Automatic Packet Reporting System + Street Atlas v 2.24."
If you don't have v2.24 I would suggest downloading it!
Hope this helps,
73, Rex, KIØBJ

2125. AEA PK-88

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-28 01:06:00 UTC
From: gtrivel
Topic: 2125 Message: 2125

Hi does anyone on the board have experience with converting an AEA PK-88 to a stand alone digi for APRS at a remote site?

Some things I have read indicate that it can be done while other indicate the opposite.

As far as I can remember, I were using my PK-88 (back in the medieval
times, five or six years ago) as a stand-alone digipeater with a 2m
transceiver. I don't know if it is possible to enter a MYALIAS, which
would be of importance. But if so, it should be possible to use it also
as an APRS digi (with a 2m trx, obviously).

The ui-view yahoo group is a much better place to ask;

however: Setup - APRS Server Setup; select one of the servers presented;
enter you Validation number (you got it along with your registration);
hit F1 to get help with the setup.
Action - Connect to APRS server - Yes (to log in).
There you are.
(provided you are connected to the Internet)

2132. APRS Performance

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-29 23:50:26 UTC
From: Bill P.
Topic: 2132 Message: 2132

I thought I would report the good APRS performance on 6 recent trips. I use a IC2AT handheld packaged with a TinyTrak3 and 10-AAs in a small enclosure with either a built in whip or a external mag mount. After 5 trips from Southern Califonia to Verde Valley in Central Arizona and another trip to San Francisco, I'm very happy to say that this rig and a Kantronics / FT817 5 watt system gave very good performance.

I used winaprs with the Kantronics KPC3/FT817 making for some interesting displays while mobile between Verde Valley, Phoenix and return to Los Angeles. During the recent storms I was able to use the WX stations for wind and rain info.

WINAPRS ran 100% for 3 days and was a life saver for text messaging, especially for a mobile operator who would usually access the internet many times per day.

Thanks to the folks who run WA6OFT and WA6LSE digipeaters.

Suggestions: Find maps that highlight main highways and less street level detail and cover a wider geographic area.

Bill K6ACJ HFPACK

2133. APRS server filters

Yahoo group: APRS (1998 — 2006)
Date: 2004-10-30 20:54:46 UTC
From: Jan T Pharo
Topic: 2133 Message: 2133

I access APRS servers at their ports 14580, and with this filter:
filter r/59/011/1000 t/m (which at the moment is registered at
ahubswe.net)
This should restrict my area to Northern Europe.
But I still get all world.

So I could as well have been using the Full feed port.
Any clue?

The t/m in your filter will allow you to recieve any and all messages that happen on the full feed no matter where they occur on earth, a position report will acompany a message and thus show up on your screen, so if I send my friend a message, and we are both in the USA, you will still see my house icon on your screen in Europe because of the t/m

From: kerry
Topic: 2139 Message: 2139

Hello, I and a friend are both using ui-view32. He lives about 30 miles from me and we can hit each other direct if he has his beam pointed at me. If he doesn't we don't see each other on the screen. We both hear at least 3 digi's no matter where the beams are turned. Shouldn't we be digi'd through the other stations and re-transmitted out so we show up on each others screens without hearing each other direct? We both are using (APRS,RELAY,WIDE7-7) in our unproto.....thanks

You will want to change the path to somthing like
RELAY,WIDE,WIDE APRS is not part of the actual path.
You could possibly find APRS in the destination call
path in a raw packet. Try changing the path to the
mentioned above and see if you have more success. You
may even want to experiment with replacing the alias
calls (RELAY or WIDE) with the actual calls of the
digi's you CAN see. Make sure to include the numeric
SSID on the callsign if they are using one.

Example: My digi is KE4NYV-5 My friend FD's is
K4FDS-5

Using the path: RELAY,WIDE,WIDE will work because both
of our digi's will respond to those alias calls.

But, I can change the path to KE4NYV-5,K4FDS-5 and now
my packet will be forced to use those digi's only.
This packet can also be received direct. If neither
digi's were to hear the packet, the packet would die
right there.

Hope that helps some,

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-03 01:15:20 UTC
From: Ron Cluster
Topic: 2139 Message: 2141

The path is OK (sort of....) I would definitely drop the WIDE7-7 down to WIDE2-2 for a maximum.

If you are in an area where the digi's do not support RELAY, then you should remove that from your path.

With UI-View32 you do need to include the APRS at the beginning of the path as you have it. Some other APRS software fills that in for you. UI-View allows you to choose what goes in there which makes it much more versatile.

If there are other users in your area, I would ask them what path is commonly used. It does differ somewhat from one region to another. For home stations in the NW US, the recommendation now is APRS,TRACE2-2 but again, check locally.

One more thing, IF you decide to use RELAY, RELAY should ONLY appear
as the FIRST call in the path and never anywhere else in the path.

>(APRS,RELAY,WIDE7-7)

In UI-View's station setup, the unproto path should look like that, with
APRS as the first element (saying: this packet is to "APRS", via RELAY
and a number of WIDE)
However, if the first digipeater in the path does not have RELAY as an
ALIAS, it won't recognise the packet as something it should care about.
(about the 7-7, observe advice from other APRS hams in the area).

(for UI-View specific matters, try using the UI-View list)

Well I've tried all of this, but still won't do it. Two of the three digi's I hear, I put into the unproto like this (APRS,RELAY,VE3IWJ,VE3UEL*) I still don't get my friend unless we are beam to beam. He can point his beam right at the digi and I send a beacon but he does not hear it or see me pop up in UI-VIEW. We both also tried (APRS, RELAY, WIDE2-2) (APRS, RELAY, WIDE,WIDE) Tried RELAY in MYALIAS, tried different digi's in MYALIAS also, but still won't work. Do you have anymore ideas I can try.....thanks

From: Jan T Pharo
Topic: 2139 Message: 2147

"kerry" <kerry@...>, Thu, 4 Nov 2004 01:08:00 -0500:

>Two of the three digi's I hear, I put into the unproto like this
(APRS,RELAY,VE3IWJ,VE3UEL*)

If the first digi has a MYALIAS of RELAY, the second digi is VE3IWJ, and
the third digi is VE3UEL*, this will work.
I doubt that the third digi (or any digi, for that matter) has a
callsign with an asterisk.

So if we have this situation:

Kerry <-> 1st digi <-> VE3IWJ <-> VE3EUL <-> Friend

and 1st digi is responding to the callsign RELAY, you should remove the
asterisk in your unproto path.

Your friend (and the rest of us) is a part of the APRS address (that's
the way it is).
The callsigns or aliases set up after APRS in the unproto path will tell
hearing stations to do something or nothing with the heard packet.
If a station working as a digipeater has an alias setting of RELAY, ant
this station is hearing your packet _directly_, it will handle it and
look for the rest of the address. With your (now asterisk-free) unproto
setup, it will retransmit it. Then, if a station with the callsign
VE1IWJ hears it (AFTER the RELAY digi), it will handle it and look for
the remainder of the address. As the address still contains one
callsign, it will retransmit it. If a station with the callsign VE3UEL
hears it, it will handle it, and retransmit it to APRS, that is,
generally speaking, to all of us, including your friend. He (and you)
should be able to monitor some or all parts of this traffic as long as
his (and your) station is hearing any of the stations involved (i.e. the
digis). A you are using UI-View, try to open the Terminal window in
UI-View to watch the traffic heard.

It will seem that no digipeater able to hear your original packet is
equipped with an alias of RELAY.

For your own purposes, it does not matter whether your station has a
MYALIAS of RELAY. This setting is just an aid for other stations
(mobile?) having an aprs setup transmitting to APRS via RELAY,WIDE2-2
(or similar), like many mobiles have; then they may get a better
take-off from your station acting as a RELAY digi for them. This is
recommended, at least where APRS population is sparse.

I am sure there is some documentation of this available on some PRS
related web site, or maybe in an ARRL publication. Bob Bruninga, APRS

author, will undoubtedly have published a description.

Kerry-
I've only worked with the Byonics TNC's (TinyTrak, PocketTrack) and can't give you a whole answer. But last week I was receiving a direct acknowledgement back from the local digi and stumped to see nothing on FINDU. Repeatedly.
Solved that by messing around in the TNC parameters, either the setting to use/not use Mic-E, or a Mic-E parameter, or the setting to "send only valid" on the GPS, something was stopping the result from posting on Findu. I fiddled with all those, didn't really think I had changed any, and with the addition of a LIVE GPS instead of one pre-set location, all of a sudden I was on FINDU.
I'm not at all sure it is supposed to be this way...but make sure you have good GPS data going into that TNC. APRS can be very frustrating, you're not the only one to have noticed that.

To make it to FindU, your packet needs to be monitored by a station gating
traffic to the Internet. That might be a few WIDE hops away, and can
sometimes take a little time.

HTH,

2154. H2O (and other Symbols) on Findu

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-04 19:46:45 UTC
From: Steve
Topic: 2154 Message: 2154

I just did a Findu search of my callsign, KC5SAS, to make sure I was getting ito the system well and noticed that there are tons of new icons on the list of nearby stations. Most are blue squares with H2O which were put up after the heavy rains passed through the Baton Rouge area yesterday. There's icons representing Baton Rouge Airport and the occasional LIX_Outlook (no activation expected) icons popping up. Who puts all of this stuff up and clutters our screens with it? There's no callsign or email attached to much of it. Sure there was street flooding but putting up all of those icons, if not done automatically, must have take some time and effort.

2155. looking for a video prentation about APRS

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-05 00:08:41 UTC
From: gervais
Topic: 2155 Message: 2155

hi all
is there a video presentation about APRS somewhere
that i could download??
that would explain different aspect of the APRS
as a ststem and softwares available

thanks for the help
gervais,ve2ckn

now with an Igate for my region.

2156. RE: [APRS] looking for a video prentation about APRS

Subject: [APRS] Which SSID

I have a receiver (can't transmit at the moment) connected to my UI-view. When mobile stations are passing by, I relay them to the internet. Which is the right SSID to use for my own station which others see on their screen?(ON4HSO, ON4HSO-2, ON4HSO-4 ??) Where can I find a comprehensive list of all SSID to use ?

2159. Re: HOW DOES THIS WORK

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-05 15:57:45 UTC
From: KC2MMi
Topic: 2139 Message: 2159

>But last week I was receiving a direct acknowledgement back from the
>local digi and stumped to see nothing on FINDU. Repeatedly.
<<To make it to FindU, ...
<<sometimes take a little time.
John-
In this case, TNC#1 was reported on FINDU within the usual seconds.
TNC#2 was not making it, at all. The problem was in TNC setup, not the delay
to FINDU. None of what I poked should have mattered, so I'm assuming it
wasn't posted because of lack of live GPS data or some glitch leaving "bad"
data in the TNC before the GPS was connected.

Hello to the group,

The display of all the wx, h2o, metar, and other posits was caused
by an errant instance of Xastir with a slight bug that has now been
fixed. Xastir users are urged to download the latest version/update
of Xastir.
The data is from the Firenet group who provide a number of
additional data products to the APRS community by connecting to the
Firenet.us servers.

Problem is solved and you will not be seeing the data any longer
unless you connect to the Firenet server.

2170. Re: [APRS] best mobile radio for APRS

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-08 00:23:39 UTC
From: Jeff Kelly
Topic: 2167 Message: 2170

I am using the Alinco DR-135TP with a Digitraveler.
For basic tracker type APRS it works fine. However
I have been experiencing TNC resetting which resets
all the commands back to default. I am trying to work
this out by playing with steady power sources etc.

I would say the Kenwood is probably the best and if you
got the money do it but you can get started for less with
the Alinco.

From: w8aii
Topic: 2167 Message: 2172

I use a Kenwood TH-D7A(G) along with a 35 watt Maha Docking booster. Nothing mounted permanant as I usually move the setup between different vehicles. The D7 allows me to keep one VFO on APRS and the other I keep on VHF 146.52. I also use a Garmin GPS V with an external antenna. The setup works very well for me but I'm looking at getting a smaller GPS unit in the future.

Hello to the group,

The display of all the wx, h2o, metar, and other posits was caused by an errant instance of Xastir with a slight bug that has now been fixed. Xastir users are urged to download the latest version/update of Xastir.
The data is from the Firenet group who provide a number of additional data products to the APRS community by connecting to the Firenet.us servers.

Problem is solved and you will not be seeing the data any longer unless you connect to the Firenet server.

HTH,

Randy - KK6RW

Gervais,

I am not an expert on APRS by no stretch of the imagination (I'll leave that up to Bob Burninga WA4APR), but I did put together a well received Powerpoint slide presentation for the local ham club on APRS in general. You are welcome to use it as the information in the slideshow was gleaned from various websites on the net, so I would consider it to be in the public doamin. You can find it as a Adobe Acrobat PDF file on my website http://www.radioroom.org under the APRS tab or direct to the file at:

http://radioroom.org/public/APRS/APRS_Overview_rev2.pdf

Good Luck,

Gene Brewer KI6LO

From: Ronny Julian
Topic: 2176 Message: 2176

I was looking for setups for bicycles/motorcycles and came across this.
Now thats a radio install!

http://microship.com/resources/winnebiko-behemoth.html

I had thought of getting another bed cover for the truck and covering it
with solar panels to keep up a couple of gel cells. Anyone seen that
idea done well?

List of stuff for sale
-=-=-= Bearcat BC-235XLT 300 ch trunktracker scanner. 2 bt and cgr. $60 -=-=- Motorola VHF 6 ch HT-600 "144.390", "145.01", "145.03", "146.82R", "146.52", "146.88R" with good battery and drop in charger $75
-=-=-=- Motorola UHF 6 ch with battery and drop in vehicular charger/bracket/cable. I can get it programmed to spec. $75
-=-=-=- 12 Channel GPS board with documentation. TTL level Serial interface (works well with TT3) $40 with antenna
-=-=- Kenwood TH-22AT 2 meter HT with 4 cell AA pack and ant. $60
-=-=- MFJ 1270B TNC Few scratches on case. Works fine. $70
-=-=- MFJ 1270B TNC scratches on case also. needs to be retuned by someone with a scope. $35
-=-=- 1.5 amp 12vdc wall transformers center tap + pretty much a standard barrel connector. $5 ea. These would be ideal for a QRP rig.

email off list. CONUS shipping by UPS

Terms Paypal prefered USPS M/O accepted. Buyer pays actual shipping

Thanks for looking! More will be listed this week as I unpack and make notes.

Dear Group,

Does anyone have a source or web sight for the pFrank connectors that will actually respond to you? I've tried several of the "sales sights", I've begged, I offered more than they ask, I've followed the instructions for ordering but I am only met with silence.

Perhaps someone on the group has gotten them or sells them can help me. OK to reply to jgalt54@.... Thanks.

Thanks and 73

2189. STILL NO RELAYS

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-21 15:46:49 UTC
From: kerry
Topic: 2189 Message: 2189

Hello all, I am still having trouble getting my mobile station to relay through my base station an on to a WIDE area digi. I'm running UI-VIEW, the base unproto is (APRS,RELAY,WIDE,WIDE) My mobile unproto is (APRS,RELAY,WIDE3-3) AND ALSO TRIED (APRS,RELAY,WIDE7-7) AND (APRS,RELAY,WIDE,WIDE). I would like my base to hear the local wide area digi's and relay the heard stations to my mobile when I am out of range of the digi, but not my base station. Also would like my mobile to be heard by my base station and relay my beacon to the other stations and digi's in the area. Is this possible? I can send a beacon that I know my base can hear and it does not key up and relay it out to the other stations. Anyone have ideas?.....thanks
Kerry-WA2NAN

>Hello all, I am still having trouble getting my mobile station to relay
>through my base station an on to a WIDE area digi. I'm running UI-VIEW, the
>base unproto is (APRS,RELAY,WIDE,WIDE) My mobile unproto is
>(APRS,RELAY,WIDE3-3) AND ALSO TRIED (APRS,RELAY,WIDE7-7) AND
>(APRS,RELAY,WIDE,WIDE).

As you have set the unproto path for your base to first send to a RELAY,
but are stating that the nearest digi is a WIDE, it won't recognise your
packet as one it should digipeat. Also, take a look at my message in
this group of nov 4th.

First, check with the owner of the nearest digipeater if he/she has set
RELAY as one of the aliases in the digipeater. If so, your base station
Unproto path should be all right.

If the digi does _not_ have RELAY as an alias, you should try
APRS,WIDE,WIDE in your base setup.

In the digipeater setup of your own base station, set RELAY as one of
the aliases (read the help while looking at the digipeater setup in
order to do this right) - because you have set RELAY as first via in
your mobile setup.

First the most basic question. Do you have the digi set up and
enabled in UI-View?

I should try to set your own base station digipeater to react on either
APRS or
RELAY or WIDE, in the digipeater setup menu.
I think that maybe you should try to remove APRS from the string sent by
your mobile unit.

Next step: If the beacon from your base station is not visible on FINDU,
try to
remove both APRS and RELAY from the string sent by your own base station.

Robert Lind <r@...>, Mon, 22 Nov 2004 07:00:00 +0100:

>I think that maybe you should try to remove APRS from the string sent by
>your mobile unit.

"APRS" is the destination address, like "CQ" in normal packet work (not for position reporting). It is used by all who wants to address all other APRS users, if they're not running a separate net, so I don't think you would really want to remove that.

In e.g. the Kenwood TH-D7, this destination address is set in a menu separate from the unproto path; in the unproto path menu one would put RELAY,WIDE,WIDE hoping that a RELAY station is close enough most of the time (and WIDE,WIDE or WIDE2-2 or whatever is depending on the APRS neighbourhood). If the mobile unit is indeed a TH-D7 or a TM-D700 running as APRS standalones, the address items "APRS" and the path (e.g. RELAY,WIDE,WIDE) are entered in different menus.
In UI-View, however, APRS is set as first item in the Unproto address field in Station setup.

PcSat has gone belly up for the long run and can be heard sometimes. So you might be able to see it but don’t count on it. IF we can get the space program back up and running we can have a few more sats such as the ISS as a digi.

2197. Using Garmin 2650 with APRS

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-24 15:26:42 UTC
From: jminehan
Topic: 2197 Message: 2197

Has anyone tried using the Garmin 2650 with APRS? I am considering buying one to use with my Kenwood D700 but want to be sure it will work before making the investment. I would be interested in hearing from anyone who has successfully done this.

Thanks.

John

Yes PcSat is NO-45
and sapphire is NO-44

and both are up and running in daylight hours when they pass over.

From: J. Rausch
Topic: 2185 Message: 2205

I contacted John off-list.

But for general knowledge. I also stock and sell the Pfranc connectors. I also produce and sell custom Garmin GPS and TinyTrak II/OpenTracker radio interface cables for numerous APRS applications. I'm located in Roanoke, Va. and can usally ship parts within a 1-3 days of getting the order, stock on-hand depending.

I don't show up on Larry's list as a distributor because I'm not a full Pfranc, instead a Pfranc franchise reseller (Larry came up with that title)

My company site is: http://www.rpc-electronics.com

Thanks,
Jason KE4NYV

2207. New version of APRSPoint available

Yahoo group: APRS (1998 — 2006)
Date: 2004-11-30 11:08:04 UTC
From: hxc98
Topic: 1962 Message: 2207

Version 2.1 of APRSPoint is available. It integrates Microsoft MapPoint seamlessly to provide detailed street level support to track other hams all over the world through either RF link or internet. Visit http://www.aprspoint.com for latest info and the holiday special. Thanks.

2208. Warning: TIGER map positions

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-01 01:59:28 UTC
From: KC2MMi
Topic: 2208 Message: 2208

After two weeks of pursuing a question of large errors (200-250 feet) on the TIGER (US Census) maps used in so many APRS mapping systems, and the priceless help of several parties (especially Gerry Creager N5JXS) I was finally informed by the Census rep that this past April 2004 they released the 2003 TIGER files, which include *significant* changes in over 100 counties across the country.

Anyone who is or has been using TIGER maps (i.e. the default on FINDU and APRSWORLD or on their own computers) and has been seeing significant errors in reported position displays, is encouraged to check out <http://www.census.gov/geo/www/tiger/tiger2003/tgr2003.html> to see if your county is on the list of revised maps.

The nice folks at the Census also remind me to say their data is not intended for any precision mapping purposes, they make no warranty for that, their business is only demographics.

So...If you already know about map datums and haven't been able to figure out why "this APRS stuff just ain't right"...here's one more source of error, and a way to find out if it has been affecting you.

This is not to say that ALL of the Tiger maps have problems, that's not what I've said. Just that anyone using the TIGER maps needs to confirm their accuracy in your own area, before you believe the "red dot" on the map. In some areas, it is confirmed that dot will be 200-250 feet off position.

One way to verify this is to use the www.acme.com map server. Look at your reported position on the TIGER map, then go to ACME and look at it on the USGS TOPO map. If the two change, believe the TOPO.

2209. RE: [APRS] Warning: TIGER map positions

2211. Dynamically refresh

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-01 16:38:54 UTC
From: Henk Oegema
Topic: 2211 Message: 2211

I have an APRS screen of my area running on my ISP server. The image is updated every x minutes. A user connected to that website has to refresh manually to update the image. (not only the image is updated, but the whole page)
My question is:
How can I dynamically refresh every x minutes the APRS image only from the server end (server push) ?
Do I need a JavaScript? If so, is there anyone who can help me with the code? Can I find the code (or an example?) on the internet? I could not find one that helps me out enough. Don't have much experience

<<You are not trying to use it with UI-View are you ???

Josie, this is not a question of UIV and PMaps. I don't know which map datum and source(s) Precision Mapping used, I think they are WGS84 and the USGS maps here in the US, which are more accurate. The problem is only in the use of the TIGER maps, created by the US Census from a variety of sources, and not intended for positioning uses according to their maker.

The problem with the TIGER maps will vary *again* depending on which year's maps are used, and which county within that year, since their corrections are just beginning. (They've said they are aware of the problems, but can't get funding to fix them.)

If you use the TIGER maps as a base, *every* program will show positions incorrectly in the areas where those maps are in error. And for most of the country, there may be no errors. I thought the error here was an NAD27/WGS84 datum shift, but Census finally researched it and found an even more obscure problem, which is now supposedly corrected in one borough...but not the other 80% of this city. And doesn't affect anything in the neighboring counties. Makes it even more fun. (NOT.<G>)

Since everything I've seen online (i.e. FINDU and APRSWorld) has been defaulting to the TIGER maps, and nothing I've seen online has brought up this problem, I thought a heads-up was in order. This is not to knock the great efforts of the folks at Findu and APRSWorld--they've done us all a great service and they have my unreserved admiration for their work!

This is a damned esoteric error for the casual user and there's no reason they should have expected it. Even reading the (yawn) 360? page PDF explaining how to use the TIGER maps, and the TIGER web pages, it is hard to find the problems mentioned at all. Most of the posts of "the map is wrong here" seem to be user/datum errors, and it is easy to mistake these for more of the same, the way I did. But...there was more to it than that. TIGER just isn't supposed to be relied on this way, even though it sure LOOKS like it can be.

(It took most of two weeks for the Census folks to track it down for me!)

Henk, I suggest using the HTML code:

```
<meta http-equiv="refresh" content="300">
```

where 300 is the seconds, which you can adjust to your timing by simply entering the amount of seconds you wish for a refresh.
This code snippet, placed in the HEAD section of your HTML page will refresh the page without user intervention.

Using this code assumes you have some other means of updating your maps on your server.

Hope this helps,

Randy, KK6RW

Thanks Randy.
But this will update the whole page isn't?

Is it possible to update only the MAP and leave the rest of the page untouched?

(My map on the server is updated automatically by UI-view)

The maps of the UI-View web server are updated by UI-View, and when it's
updated, it _is_ updated.
AFAIK, the user visiting my web page will see the page as it is updated.

So I am not quite sure what you want to achieve.

(maybe it's an idea to ask UI-View questions in the UI-View group?)

Well Jan, may be I have to explain myself better. The MAP is updated every x minutes on my ISP server. That part is OK.
But in my case I mean how can the screen of the person visting my webpages be updated automatically every x minutes, without pressing the refresh button. (Just like a webcam can send an updated picture without refreshing the whole screen). Randy (see above) gave me already a hint. His method updateds the whole page and after the update the page jumps to the top and the MAP is out of site. That's why I am looking for a method to update only the MAP and not the whole page, so that the map will stay in site.
I didn't want to put it in UI-view, because the problem is not directly related to UI-view, but it is a general programming issue and I was afraid you should through me out. (hi)

On my UI-Webserver page, the map that I see is updated when the new map
is imported. I have no "refresher" line in the code (as you can see if
you visit the page at <http://la2bba.no-ip.info:8080> and take a look at
the source)

Well, I wouldn't throw you out, would I :-)? I might hint that it's off
topic (if it _were_ off topic)...
It's an UI-Webserver matter, as far as I can see.
Or are you sending your map to a page on a web server other than your
own PC?

(I am not sure if it is possible to include some refreshing code in the
image portion of the web page. Maybe the page should contain a text line
suggesting that viewers set "update whenever the page is updated")

Jan,
I am indeed sending the updated page to another webserver. My ISP.
The map is transferred from my pc to my ISP by an automated FTP
transfer every x minutes.
I am coming a little closer with IFRAMES in my HTML code. (as a hint
from Ken Linder - KC7RAD) But I am not there yet.

> Henk ON4HSO / PA2HO (ex-LA0GK)

Henk,

Here is some code from some webcam software I used to use. It's
javascript that refreshes the image every x seconds; The following
code should go in side the <head> of your HTML page:

<script LANGUAGE="JavaScript" type="text/javascript">
<!-- hide
// "var speed" is the refresh rate adjustment in seconds.
var speed = 300;
var y = 1;
var x = speed + y;
var time = x - y;
var now;
campicture = new Image();
function stopClock() {
x = "off";
document.form0.clock.value = x;
}
function startClock() {
if (x != "off") {
x = x - y;
document.form0.clock.value = x;
if (x <= 1)
{
reload()
}
timerID = setTimeout("startClock()", 1000);
}
}
function reload() {
now = new Date();
var camImg = "[put_your_img_url_here]" + "?" + now.getTime();
document.campicture.src = camImg;
```

```
x = speed;
document.form0.clock.value = x;
}
//end hide -->

</script>
```

Add this to your <body> tag:

```
onload="startClock()"
i.e.: <body onload="startClock()">
```

Then make your image tag like this:

```
<IMG src="[put_your_img_url_here]" name="campicture" alt="Picture">
```

It's keyed to the "name" attribute of the IMG tag, if you change the name attribute in the HTML, you need to adjust the "reload()" function in the javascript. The current name is 'campicture'. It doesn't appear anywhere on the displayed page, so you may not want to adjust it. The timing is set there at the top with "var speed=300". The 300 is seconds, so it means it will update every 5 minutes. You can adjust it.

Joseph

I get an error message in the function startClock():
Error: document.form0.clock is empty or no object.

(the same line in the function stopClock() does not give an error
message.)

I suppose it is because of the error message that the image doesn't
update.
But I am very close to the solution how I want it. Hi

Oops. I suppose you should also add a <form name="form0" ...> type element to your web page with a hidden field "clock".

Look at http://www.lightningflash.net/webcam.html

The webcam isn't working, but if you look at the source to the HTML, you can see how it works and use that code.

```

I have copied the Javascript from the source code of the page above exactly as it is (only changed: var camImg = "http://users.telenet.be/henk.oegema/on4hso.jpg" + "?" + now.getTime();
I don't get an error message now.

In the <body> I have:

```
<body ................>
..........
..........

<text="#000066" bgcolor="#FFFFFF" link="#0066FF" vlink="#00AAFF"
alink="#FF0000" onload="startClock()">
<FORM action="JScam.html" name="form0">
<CENTER>
<IMG src="on4hso2.jpg" name="campicture" alt="Brussels-Leuven-
Mechelen area.">
</CENTER>
<CENTER>
<INPUT type="hidden" name="clock" size="3" value="">
</CENTER>
</FORM>
</body>
```

No updating is taking place however!! I think the error is somewhere in the body part.
What is: <FORM action="JScam.html" name="form0"> ?
What file is "JScam.html" ?

Henk, ON4HSO/PA2HO

2228. 9600 baud APRS Nets?

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-03 16:44:45 UTC
From: Ken Linder
Topic: 2228 Message: 2228

I have been doing some reading on APRS... Have only been active for about a month now. I was just wondering why there aren't more 9600 baud APRS networks. It seems to me that the APRS routing implementation is ideal for quite a few other applications but since the typical 2M APRS network runs at 1200 baud, many applications would simply overload the network.

Thoughts? Comments?

Topic: 2211 Message: 2229

Here is an idea. Place your image in it's own <iframe> page. On your page where you have
<img src="on4hso2.jpg" alt="Brussels-Leuven-Mechelen area" border=2>
Replace it with something like <iframe src="aprsmap.html" width=650 length=450 frameborder=1></iframe> Now, place the <IMG> link to your APRS map in a seperate HTML file called aprsmap.html It might look something like this:

```
<html><head>
<META HTTP-EQUIV="refresh" CONTENT="60;
URL=http://users.telenet.be/henk.oegema/aprsmap.html">
</head><body>
<img src="on4hso2.jpg" alt="Brussels-Leuven-Mechelen area" border=0>
</body></html>
```

This will display your entire page but only refresh the image once every 60 seconds. Change the 60 seconds to whatever you like. One note: This may not work on all browsers but should... hihihi

A great HTML help site I use, is http://www.htmlhelp.com/

As far as doing a 'server-push' to the browser client, that is rather difficult and would require more than HTML. Java script or some other tool would probably be necessary.

Hope this helps.

Hi Ken,

This is a very good question, and the answer is complex. I have been on packet radio since 1984, assisted in sending a connect packet down a 220mhz linked repeater system during a red cross experiment, sent packets on the amateur satellites, and lastly operated a 9600 bps JNOS node for years. I witnessed the formation of a 9600bps backbone from LA to Sacramento ,CA that seemed to work well using TNOS TCPIP. It was disheartening after all of this to see the backbone go away, and 9600bps abandoned by most of the locals for the internet. I heard of APRS in the early days,and regret not paying more attention to it. I still maintained my local 9600bps node to keep a 24hr conference bridge going for messages from a couple of the faithful.

Fast forward to present day and now I am rediscovering APRS with the Igates. Gone are the HF Packet gateways, and BBS forwarding, and the local backbones seem to be totally defunct. The backbone hams did try the 56K GRAPES modems, but perhaps success was difficult due to a vanishing user base to stimulate continued development and investment. Yes.. it seems that 1200baud packet is making a big comeback, and everything that was old (including the early problems of congestion) is brand new all over again. I am sure the original Bearded Experimenters from TAPR who started packet radio in the first place must be chuckling . Local ARES and RACES folks are jumping up and down over packet and APRS on 1200baud. Text messaging via radio is becoming quite popular again. Hey.. the tnc is now in our Cell Phones!! Keyboard to Keyboard is coming back in a big way.

In the early days, you had to modify your own radio to get on 9600bps . I had modifed four multimode ICOM radios for 9600bps with ease,

but the lack of commercially available radios probably acted as a barrier to most. I read with dismay that some recent 1200baud users felt that 9600 bps was not effective, and useless. This was indeed totally wrong since I have been running a JNOS node for years with zero problems in coverage. The key is to use higher power, and beams where necessary. I have used circularly , and horizontal polarized beams for years with no problems in cross polarization. The problem noticed years ago with some folks is that they were STILL using tnc parameters designed for 1200bps. The 1200 baud mindset still seems to be with us in present day among many new packet users.

Can 9600 bps work for the present day APRS local users ? Absolutely if they setup their tnc parameters properly , use amplifiers with fast diode TR switching, and install simple beams as needed.
Lack of a decent radio is no longer a problem with Alinco , Kenwood and now ICOM radios that run 50watts or more with built-in 9600bps TNC's. I sure wish we had back then what we have now. There should be no excuse for getting active .
In the past, folks would have problems with multipath distortion corrupting their packets, and gave up. Proper use of beams, circular polarization , and simply more power can effectively eliminate most of the perceived trouble. Adjusting TNC parameters to allow the radio setup to properly settle down before transmit and receive turnaround is still recommended for amplifier use, but not a problem with today's faster , barefoot radios and data communicator HT's.

With the APRS connectionless protocol, it will be easier to deliver messages back and forth in quick bursts. I had kept a JNOS node going in connected mode for months to years with only an occasional problem due to power failures, and heavy rain storms. When the rain was gone, the JNOS nodes would reconnect themselves without excessive retrying . What about 9600bps in mobiles? It should still work as long as one is running sufficient power into an efficient antenna with some gain. The use of a Halo loop antenna , which works well for SSB mobile, can do an excellent job for reducing dropouts in the packet.

The folks who had reinvested time and money back into putting up the wide area APRS nodes should all be patted on the back. Now if only these generous folks would attempt to reactivate 9600 bps and learn from the past. It really does work well, but died from lack of USERS. Now that we have growing numbers of APRS users, node owners should give it a retry.. (sorry.. I couldnt resist) :-)

73,

Ken WB6MLC

Thanks Ken for your advise. I have tried it. It works ok, except
that the map doesn't fit entirely in the new <iframe> page.
It (at least I couldn't) was not possible to extend the length of
the iframe page so that the map would fit without scrolling up or
down.
That's why I have choosen for the option to include a small
JavaScript to refresh the map. That also works fine.

Topic: 2238 Message: 2238

I bought a Pk232 MBX V7.0 and can not get it to transmit my position. I messed with it for a while and kind of gave up. I then wired up an MFJ 1274 and it receives just fine but I am not sure if i have the setup parameters correct. Does anyone have the setup commands for it so that I can get back on APRS+SA?

Thanks

2239. Looking for help with Digi settings - long...

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-15 23:46:28 UTC
From: Stephen R. Look
Topic: 2232 Message: 2239

I'm setting up a digi in Monticello, IL and looking for assistance with proper configuration. I am most definitely a novice at this. Main purpose of this digi is to provide mobile coverage to Piatt County and act as a fill between Decatur and Champaign. Monticello is about 20 miles to either Decatur to the west or Champaign to the east. During storm spotting we'll be wanting to send timely reports to our local NWS office in Lincoln which has APRS station WD9CIR.

Hardware is a MFJ-1274 with TAPR DCD mod and UIDigi firmware and Motorola Syntor.

This will eventually be placed on the local grain elevator. I can now reliably hear two digis directly - WA9RES, W9MBD and an igate, W9ADS. I would imagine more when placed in operating position.

I don't know if I should try to make this a WIDE or some type of LINK or RELAY to one of the existing WIDEs.

I want this to be a good neighbor so will appreciate any assistance.

Looking mainly for correct settings for:
digialias, digicall, uidigi, uiflood, uitrace, and unproto

From: Randy
Topic: 2232 Message: 2240

As Phil said, RELAY, WIDE2-2 should be a good starting point unless you are in the So. California area. They do not use RELAY there, you'll need to go with WIDE or WIDE,WIDE2-2.

Check with your local APRS users also, there may be a local LAN network or a secondary frequency for trackers.

2241. Fwd: [APRS] Looking for help with Digi settings - long...

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-16 21:21:44 UTC
From: Andrew P.Ban
Topic: 2241 Message: 2241

Steve,

There is an ongoing discussion at the TAPR aprsig mailing list about this
topic you may wish to check it out. I copy/pasted the summary which should
put you on the right track.

Andrew

----- Copied Message -----

[aprssig] The new APRS n-N Paradigm SUMMARY
From: "Robert Bruninga" <bruninga@...>
To: <ad6nh@...>, <k6tvi@...>, <n6nhj@...>,
<sceara@...>, <wb6zsu@...>, <dick@...>,
<k7gil@...>, <aprssig@...>, <n6cv@...>,
<spentnacf@...>, <wb6jar@...>
CC: wb4apr@...

As exciement and success with the new n-N paradigm for
APRS builds, and with feedback from a number of users
I now think we can boil it down very simply to two new
systems to replace WIDEn-N (in areas that are saturated).

UIFLOOD ##LNKn-N linear systems along the ## Interstate corridors
UITRACE SSn-N within state borders (or ARRL sections in big states).

Both of these are self-limiting yet very userful for the long
haul traveler and for EOC's and Emergency APRS comms
and still fully support local operations with RELAY and WIDE
and others.

At first I just proposed LINKn-N and LANn-N generic
systems to see what the APRS community came up with.
And so far, the Interstate and STATE systems seem to
be perfect. I was worried about the need for cross state
line traffic, but in talking with many APRS users and
Emergency Comms support personnel I got these points:

1) Most COMMS nets and groups are organized by state
2) Many state borders are rivers or mountain chains which
naturally restrict commmunications needs across them
3) We are not intending for everyone to switch from WIDEn-N
to SSn-N and continue their flooding! We are intending
users to all cut their paths to RELAY,WIDE or WIDE,WIDE
or SS2-2 but do want to have a system for state wide
(or section wide) comms if needed
4) You can still listen or send traffic across to another state

if you live near one and need to:

a) Point your antenna across the river and work their digis
since the net will work better without all the WIDEn-N QRM
b) Install a local DIGI that is high and LISTENING to their
other state SSn-N system but digipeats in YOUR city
all that traffic onto UHF so that you can still be in full
communications with THAT state while not QRMing yours.
c) or if you want to support a visiting XX3-3 visiting mobile
from adjacent state XX, then put XX3-3 in your UIDIGI
list. Your DIGI will get him out, but then no incoming
XX3-2 or 3-1 or 3-0 will get back into your area..

And FINALLY, by deciding to go with UIFLOOD of ##LNKn-N
and UITRACE of SSn-N we get back to a system of universal
generic settings that visitors can infer. and we get path tracing
where needed (SSn-N) and short packets for long-haul (##LNKn-N)
where they do the most good.

USER RECOMMENDAATIONS fall back to:

REL:AY,WIDE universal for mobiles (or SS2-2)
DIGI,WIDE for fixed stations
SS3-3 for local state operations (or section).

Some digis at intersections of major interstaes may have
to use up both of their UILFOOD and UITRACE on the
two interstatesa, but an adjacent digi can probably still
support the SSn-N or you can simply add an addtional
TNC to the same radio to support the SSn-N.

Lots of exciting options. Go for it!

I have updated my FIX14439 WEB page to cover all this:

http://www.ew.usna.edu/~bruninga/aprs/fix14439.html

It still needs some more fine tuning, but will be updated
over the coming weeks.

hi all,thanks for reading this message.
i wonder what are the needs to install,establish an Aprs Server?
on Windows platform ?
Locally i am most of the time always connected at the same
server,port 1313 since i am an Igate,and sometime is getting slower
and slower that i have to change the Aprs server i am connected too
so the speed and traffic would return at his normal speed.
maybe someone here in the group would have a server that can cover
the Eastern Canada provinces,in particular Quebec .
In information will be mostly appreciated by me and my frends
locally,,we are building our networks here in Eastern Quebec of Igate
and Nodes and some Relays .

Check out the tier2 server network at

http://www.aprs2.net/

Especially check out the 14580 user defined filter port option.
I have used them almost exclusively for over a year with absolutely no
problems.

Hello,

I am new to APRS.

I am using APRSplus, SA9, Alinco DJ-V5 ht, kipSS/PE, and Earthmate GPS. It all seems to work fine.

I am planning a trip from Phx, AZ to a site in Oklahoma just east of the Texas panhandle. I have not been able to see any traffic east of New Mexico.

I know I can get info off the web, but once I get in my motorhome i will be without web access and will need to reply on my setup alone.

I won't list all the things I've tried, it would probably be embarassing to see in print.

If someone could give me a shove in the right direction, It would be very much appreciated.

I am at the stage where I know just enough to dig myself into a hole I can't get out of.

Thanks in advance,
Don

Greetings Don,
Not real sure what your trying to do, but here are a few callsigns of
APRS users in Western Oklahoma and Northern Texas.
Use either Findu.com or this url to find other APRS Stations:
http://db.aprsworld.net/datamart/near-search.php, you can enter call,
zip code or even town/city name.
N5DFQ-2 Guymon, OK
N5LZU-3 Pampa, Tx
W5OKT Woodward, Ok
KC5SII Enid, Ok
Hope this helps out!
73, and Merry Christmas have a safe trip Eastward!
Rex, KIØBJ

Hi Group,

I an a co-owner of an IRLP node. We want to put our node on the aprs map. Can anyone tell me what icon are the other IRLP node owners using on APRS? And I am using Winaprs 2.7.5 with a MFJ 1278 on APRS. I would like our club call to be ID'ed when when we send out our position but also want our IRLP node number to be displayed on the map. I have played with APRS in the past but still new to it. Any help would be greatly appreciated.

Thanks,

Bob, WA3MMD

2256. gps2+

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-23 05:23:25 UTC
From: rhs19792000
Topic: 2256 Message: 2256

Gentlemen,

Need help to troubleshoot my garmin gps2+....recently, the unit
fails to aguire any satellites....new batteries, new antenna.....
unit worked flawlessly since 99.

Any advice ?

rob hartley
livermore, ca

Remember that if the unit has not been turned on for a while it may take some time to acquire satellites again.

How long did you leave it turned on with a sky view before you decided it was not working?

I have seen the high dollar units take about 1/2 hour after being off for an extended time. That might have been due to the last location it was turned on was over 500 miles away.

Once the GPS has locked on the start up time should be quicker the next time you turn it on.

Try the stock antenna, leave the unit on and check every 5 minutes to see if it starts to capture satellites. How do you know the "new antenna" is good? Why did you switch to the "new antenna"?

Bruce

2258. Radio interfering with cruise control

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-26 16:37:30 UTC
From: Bruce & Leigh Coates
Topic: 2258 Message: 2258

Hi.

We have a '92 Taurus sedan and every time the 2m transmitter is keyed it causes the cruise control to drop about 10km/h. We're running a Radio Shack 2m mobile with a glass mount antenna on the rear window. The symptom only happens when we're on high power (45W). On low power (10W) there's no problem.

My first guess is that the interference is being picked up by the speed sensor, but that's just a guess. Has anyone else had similar problems and been able to resolve them? The more I learn here, the less time I have to spend outside fixing this. (I'm in Canada and it's winter ..... ;-))

Bruce
you may check where is the car computer .
cellular phone antenna are producing the same problem on cars that have
computer elsewhere
then around the dash board,many times around the trunk

you are producing swr and the computer sensors working at certain
frequencies is detecting it

How do you have the power connected from the radio and at what point battery? fuse box? The interference may be through the power lead also is it on all the 2m frequencies or just a few? Have you checked the SWR
Best Regards
Moe

Hi Moe

I have the radio connected to the fuse box through an RF filter. Although I posted this to the APRS group, it happens on any frequency I use the radio on. I also checked the SWR and it's <1.5:1 across the entire band and virtually 1:1 on 144.390. This is why I'm suspecting that some of the car's electronics is picking up the radiated RF, rather than it going down the power lines.

Hi Gravis

As far as I know the computer is under the dash. The only electronics in the trunk appears to be the power amp for the stereo speakers. My SWR is 1.5:1 across the band and virtually 1:1 at 144.390 so I that's why I'm guessing radiated RF getting into something rather than and SWR issue.

Sorry I did not see the other post I would try moving the power lead or shield the power lead I had that problem many years ago with a 77 olds I moved the coax and the power to the other side of the car and the problem was gone.On my olds the cruse control would kick off as if I turned it odff or hit the brake .Just some suggestions that may or no work for you.

ok bruce
one things i was thinking
if you have an scanner of good quality or best a spectrum analyser
go inside tour car,let it run between 433 and 434 mhz
humm if i am correct you will here packet coming from your aprs tx itself

and many sensors in vehicules are producing harmonics in and around uhf
frequencies
around 433 mhz

try this ??????

i have a similar problem with my Audi here
when the cllular phone is communicating with a tower to identify itself on
the network we can hera a humm in my speaker
not much to be affraid but cruise control,,,,,thats another story

2265. Re: Radio interfering with cruise control

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-26 19:24:36 UTC
From: KC2MMi
Topic: 2258 Message: 2265

Bruce, I would suggest that the first thing and simplest thing to confirm is whether the RF is getting into your car via the power lines or directly. Divide and conquer:

Can you beg borrow or steal another 12V source for your radio, and try tx'ing using that separate power supply? If there's no problem that way...fast solution, you can rewire direct to the battery (both terminals) and then use a choke if needed.

Odds are it is RF direct and if that antenna is glass mounted...perhaps it is feeding into the rear defroster grid and getting into the electrical system from there. Again, divide and conquer. Unplug the power and ground leads from the rear defroster (usually they are spade or similar fittings on the glass or near it) or else use a short alligator clip to short circuit the rear defroster--power OFF of course.<G> Maybe pull the fuse to it to, disconnect it at any points you can.

Now try tx'ing again. That rear grid is after all a big wire grid, a perfect antenna if the lengths happen to resonate at the right frequencies.<G> If its that simple, choking the defroster might be all you need to do. Moving to a better antenna on the middle of the roof itself might also help--since that would tend to put the RF above the car body, with less being directed through the interior and wiring.

It also can help to pick a quiet time (not Monday 8AM<G>) and ask the local Ford dealer, or the Ford "zone office" if they have any service bulletins about the cruise control and RF in your car. Sometimes they'll have a list of points that deal with the specific car and issue--always worth asking.

One quick question. You say the speed drops about 10Km/h. Does the speed pick back up when you un-key? If not, then it's not likely the speed sensor. It must be getting into the speed control computer.

Does it notch down 10Km/h each time it is keyed... i.e. if you set it for 80, and key/unkey/key/unkey, does the speed drop to 70, then 60, then 50, etc?

Does it matter if the signal is modulated? i.e. if you simply key the radio, with now audio, does this still occur?

Also, do the "seperate power supply" exercise that another poster mentioned.

2267. Re: [APRS] Radio interfering with cruise control

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-26 20:18:40 UTC
From: Bruce & Leigh Coates
Topic: 2258 Message: 2267

Hi Jim

The 10Km/h is just a rough number but it drops while transmitting and then goes back to the normal speed when the transmission stops. It also doesn't seem to make any difference if the signal is modulated or not.

The rear defroster theory that KC2MMI suggested sounds interesting and makes a lot of sense. Our previous car caused interference on the radio the defroster was on, so the reverse makes sense. I'll also give it a try with a separate battery. (The hardest part will be convincing my wife to let me take the battery out of her motorcycle for the test ;-))

Since it's obviously going to take some testing and fiddling around, I might not know the answer until spring. I'll let the group know what I find.

hi all
well i just received from Xyl a little wheater station from
Thermor,baught at Wall-mart.
this is not an expensive one but it is ok!

it is wireless
it is tx in the 433 mhz but at the base there is not port to connect
it at a pc serial port

i wonder if i could intercept the data between the transmetter outside
and the base receiver here in the house,,,,,decode it with a software
(that i dont know yet) if Ui-view could use it in some ways??

is there someone outthere that have play with that?????

Gervais,ve2ckn
-28 celcius here in Bic,Quebec

Bruce-

A quick question: if the cruise control is off, and you are driving down the road and you transmit does the speed indication on the speedometer drop? I know you said the cruise speed drops for the duration of the TX, but does the speedometer drop?

Most modern cars use one speed sensor that feeds the computer, and an output pin on the computer drives the speedometer, and the cruise control is just some additional code in the main computer.

Others use a separate cruise control computer and the speed sensor feed both the cruise control unit and the main computer in parallel.

Hi Mike

I guess a '92 Taurus isn't very modern. Ours has a traditional cable drive on the speedometer. I know because it's getting dry and I can either look at the needle or use the frequency of the squeaks of the cable to judge my speed. ;-)

2272. quick time presentation ???

Yahoo group: APRS (1998 — 2006)
Date: 2004-12-30 03:18:16 UTC
From: gervais
Topic: 2272 Message: 2272

hi all ,
well i have been following all these messages about APRS
Packet and more ,,,,i must say that i lost the line some
messages ago :-)

anybody have even thaught about doing a QuickTime Presentation about
APRS in General,Maybe about all these parameters that we can
choose,set on our needs or,,,guest.

There's must be someone with the hability,pedagogy to do it!
Maybe i am dreaming ,,,,before new Years ,,,we all can!!!!!!!!!!

it is just a dream,,,it would help a lot too understand all thoses
topics and opinions.

There are so much docs on the web that ,new like me,are loosing the
line in all those parameters and there meaning,there is no
replecement to a visual explaination

i hope sincelery not to be bad understood here!

73/s all of you who loved our hobby! with passion

happy new year to come

Hi Gervais

I have a PowerPoint presentation that I created for our club. You can view it online at http://www.qsl.net/ve5aa/APRS.htm . I'm not sure if it answers your questions but I hope it helps.

hi all ,
well i have been following all these messages about APRS
Packet and more ,,,,i must say that i lost the line some
messages ago :-)

anybody have even thaught about doing a QuickTime Presentation about
APRS in General,Maybe about all these parameters that we can
choose,set on our needs or,,,guest.

Hi Gervais

For my maps I use a program called Radio Mobile. It's primary purpose is radio propagation prediction but it also has the nice benefit of being able to create calibrated maps for UI-View and Winaprs (and probably others too). The two best things are that it's free and its written by a Canadian! ;-) You can find it at http://www.cplus.org/rmw/ . It looks difficult to set up, but if you just follow his steps it's not bad and you'll be glad you did. I've also placed my order for Precision Mapping 7 and anxiously await its delivery and the plug-in that integrates it into UI-View.

The idea of Relay, Wide, WIDE2-2, etc are to allow you to tailor how your signal is repeated. The ideas is that you want to get your signal to its destination an *no further* so you don't cause unnecessary transmissions. If I tried to explain it any further than that's I'd probably get something wrong. I just entered "RELAY WIDE WIDE2-2 APRS UNPROTO" into Google and found quite a few pages that may help. Some of the documentation is written with particular APRS clients in mind but the concept and the definition of the terms apply to all APRS applications.

From: Phil Reed
Topic: 2272 Message: 2276

RELAY and WIDE are generic calls. Here's why you need them:

In normal packet radio, each digipeater is assigned a name, usually the callsign of the operator. In order to connect, you needed to know the name of the digi you were planning on connecting to. If you wanted to go more than one hop, you needed to know the names of each digi. There was also an "unconnected" transmit feature, which allowed you to send a generalized message in a "broadcast" kind of way. You could still use a digi name in an unconnected frame, and the digi would relay it.

APRS was conceived as a way of setting up a MAN (metropolitan area network) without individuals having to worry about digi names. The inventor did this by setting up his digis with GENERIC names. And, the users would transmit unconnected frames to those generic names. The digis would pick up the frame and retransmit it, and everybody in the area could hear it and do whatever was appropriate with the data they heard.

In general use, there are two standard generic digi names, RELAY and WIDE. RELAY is intended as a first hop, for a user with a relatively low-powered node to get his frame retransmitted into the MAN environment. WIDE is intended for large area coverage.

So, you might set up your path as RELAY,WIDE,WIDE. You transmit. A digi that handles RELAY hears you and retransmits it, and marks the RELAY as used (if you were monitoring, you'd see RELAY*,WIDE,WIDE). The next digi would hear it, and if it was handling the WIDE generic name, it would retransmit it again (and your monitor would see RELAY,WIDE*,WIDE). Your frame would get picked up and retransmitted again by another station that handled WIDE, and that would use up your path.

Now, TNCs can typically handle up to 7 hops, but saying something like RELAY,WIDE,WIDE,WIDE,WIDE,WIDE,WIDE take a lot of air time. So, a smarter shorthand was devised. You might say WIDE6-6. The first WIDE that heard your packet would retransmit it as WIDE6-5, and when the second digit hit zero, that's it for your packet.

Now a caution: putting 7-7 on a packet is not going to do what you might expect. I live in a fairly dense APRS area (Dayton), and a single WIDE7-7 will tie up about 250 square miles worth of APRS for 30 seconds or more. I'm pretty sure that the folks in Indianapolis or Columbus (a 90 minute drive away) aren't particularly interested. APRS is meant really as a LOCAL system, and we all have to share. Depending on what you're trying to do, a path of RELAY,WIDE2-2 will probably give you terrific coverage while still being friendly to the local radio environment.

From: aprswatcher
Topic: 2269 Message: 2277

If you haven't used the Kamplus in awhile you might want to change out the internal battery, the one about the size of a nickel (CR2032).

For a hard reset, the jumper is K6, which is located on the back 1/3 of the board in the middle of the board right behind the longest chip.
Make sure power is off.
Locate jumper K6 on pc board and place the jumper on both posts.
Apply power to the Kamplus, you should see the following messages displayed on your terminal:
"checksum ok"
"... ram ok"
"128K bytes"
"replace test jumper"
Turn power off and place jumper K6 on one post only to re-enable normal operation.
Hope this helps out.
Have a Great New Year!

It's a compressed beacon, with half the location encoded into the 6 bytes.

The other half is in the beacon comment.

Did you try changing the NMEA message format? I'm not sure
which one is needed.

Press Menu
Highlight Setup
Press Enter
Highlight NMEA
Press Enter
Change your NMEA settings

Choices are
Off
V1.5 APA
V1.5 XTE
or V2.1 GSA

I would suggest trying the last one

You might also check the baud rate between the gps and the D700

In case you misplaced your manual for the 330. you can find it
here
http://www.magellangps.com/assets/manuals/newprod/manual_MA
P330M.pdf

You need to figure out the PHG for your own installation. Power is easy. Gain is pretty easy (antenna gain minus coax run loss). Height is tougher, since it is supposed to be "height above average terrain". There are web pages that tell you how to calculate it, but you'll need a topographic map.

Greetings and happy new year.

I have for sale a Garmin GPS35-HVS (supply 6-40VDC). This unit has never been used, although its cord was cut to 30" for a project. I will include the rest of the cable and the manual. See:

http://www.garmin.com/products/gps35/

This is a top of the line OEM sensor that sells for $179 new (from Adventure GPS). I will part with it for $100. Please email me off list.

Thanks and 73 de Bud

Gervais -- try this as a resource:

http://www.ccarc.net/haat.html

Using the instructions on this page, and a topographic mapping
program, it took me about an hour to calcuate. It was interesting,
as I learned that the HAAT of my antenna, which is mounted 30 feet in
the air on my roof, is actually about a negative 20 feet. Guess that
is what to expect when you live in a valley.

Sorry, but I don't have access to topographic data for your location.
There used to be an FCC web site that could calculate it for locations
in the United States, but I'm pretty sure it didn't work for Canada.

Also don't forget to deduct your coax loss from your antenna gain.

2289. New to APRS: Garmin Etrex Legend to TH-D7AG problem

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-06 07:30:20 UTC
From: Greg
Topic: 2289 Message: 2289

Howdy's I'm a noob to APRS.

I have a Garmin Etrex Legend, and a TH-D7AG. I bought a unwired interface cable for the GPS unit and built a cable for the radio (with the provided one)

I set the GPS to NMEA protocal, and the interface on.

On the radio I have set NMEA, however it is not recieving the Location position data.

Is there a problem in the interface? Or is there a software change the needs to be made, I'm kinda lost here.

Thanks,

Greg, N8PPZ

Hello Greg,

I have the same setup, used the cable that came with the Etrex to connect to the computer and the programming cable from the D7 to computer, had to get a null modem gender changer to connect both. If you turn the gender changer one way, it will not work, turn around it works great. You might swap the 2 data wires and check again.

In addition to Thomas' thoughts in another post, you should be sure to
plug the cable in the GPS connector of the TH-D7 when connecting to the
GPS.

I have two cables; one for PC<->TH-D7 and one for GPS<->TH-D7, and I
have marked them on the 9-pin connector to be sure which is which.

I was just going to make the same comment. The KW manual would lead 9 out of 10 people to hook the wires up backward. I found out the hard way too! Reverse the wires and it'll work fine.

Hello Greg,

I have the same setup, used the cable that came with the Etrex to connect to the computer and the programming cable from the D7 to computer, had to get a null modem gender changer to connect both. If you turn the gender changer one way, it will not work, turn around it works great. You might swap the 2 data wires and check again.

From: Randy
Topic: 2272 Message: 2294

Catching up on the digests, I came across this thread and wanted to add a quick comment.
You're explanation of paths is very good Phil. The only thing I suggest is a caution about the use of the RELAY path in a home station unproto path for any extended period.

If your local APRS network has many digis, low level and high wides, using a unproto path of RELAY, WIDE, etc... will result in a transmission by all digis within hearing range of your home station. This of course is assuming the digis will respond to RELAY. A brief test using this type of unproto path would be useful to determine the charactistics of your local APRS network. This would then give you an idea of the digi or digis you would want to use and give you a better idea of the unproto setting for your home station.

A good way to get an idea of your local network and digis available is the use of the TRACE path. Most digis will respond to a TRACE or TRACEn-N path which would then show your path when viewed on FindU.

I realize Gervais is just setting up an APRS local network so this information may not apply to his situation now but will in the future once his local APRS network is working.

I offer this information as when I was first getting into APRS, I did have a path of RELAY,WIDE. A local ham kindly helped me get the path situation figured out. Keep in mind this is for fixed home stations. A path of RELAY,TRACE2-2 would certainly be appropriate for a mobile station as you traveled.

73,

Randy, KK6RW

2297. APRS Weather Stations

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-13 03:01:51 UTC
From: John
Topic: 2297 Message: 2297

I am looking at setting up an APRS weather station at my QTH located in Omaha,Nebraska. I have looked at Peet Bros, Oregon Scientific and Davis weather stations. Here in the midwest winters can be quite harsh. I am running UI-View 2.03 and a Kantronics KPC-3 plus. I would like to hear from anyone who has had any experience,good or bad, with any of these manufacturers mentioned or even those that are not.

Date: 2005-01-13 15:30:02 UTC
From: Bud Talbot
Topic: 2297 Message: 2299

I have been running UIView 32, a KPC-3+ and an Oregon Scientific WMR968 wireless station for two years with no problems. The station runs 24/7 and beacons via RF every 10 minutes and via the internet every 5 minutes.

I also use Weather Display to collect the data and write the wxnow.txt file for UIView to read. It is also nice for uploading data to web pages, etc.

You can view the wx data and my web page created by Weather Display at:

http://ucsu.colorado.edu/~talbotr/KB9WVG.htm

and of course the findu page:

http://www.findu.com/cgi-bin/wxpage.cgi?call=KB9WVG

Be sure to check out the Citizens Weather Observer Program (CWOP) as well so you can put your WX data to good use.

Good luck and 73
de Bud KB9WVG

Hello John,

I am using the Peet Brothers Ultimeter 2100 at my home. I looked at all the stations and decided this one was best for me. One decision is to go wired or wireless. The Ultimeter is a wired system (Although they do offer a wireless system) and it was very easy to install and set up. I have not had a moments problem with it.

For software I am using Weather Display. It is great software. If you decide on Peet Brothers, DO NOT get their "Wetaher Outlook" software. Weather Display has soooo many more features and it works!!

I hope this adds to the information you are looking for.

2303. 10 MHz transmitter for APRS

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-13 03:30:09 UTC
From: Ken Kinyon
Topic: 2297 Message: 2303

After looking at the gaps in 144.39 coverage along some of the routes I travel, I think I want to put a tracker on 10 MHz in my truck. I don't need to receive, I only want to show up on the internet. I don't want to tie up the HF transceiver. Any ideas for a inexpensive transmitter? Crystal control would be fine.

2304. Need help getting started - mobile beacon

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-19 18:39:37 UTC
From: ku4zs1
Topic: 2304 Message: 2304

I am new to APRS but not to computers. I am a graduate student at USC (South Carolina that is) in the CS program, but I live in Spartanburg, SC. I'd like a mobile beacon for my car so my family can see where I am on my 2 hour drive to and from school.

I plan on ordering a KPC-3 Plus from HRO today or tomorrow. I know there are simpler "beacon only" packet modems like the TinyTrac, but for the little extra money I'd like to have a full TNC just incase I dont like the car beacon or if I want to hook a computer into the TNC while it is in the car. Also I plan to order a Motorola M10 or GM300 VHF to use as the radio. I am very familar with Motorola equipment and they are extremely reliable (no way it can get knocked off freq accidently or anything since it is programmed with a specific freq, also COR and audio signals are extremely easy to get to). I have a Garmin GPS 38 that I would like ot use for this project, but it doesnt have an external antenna jack. I know there is a PC and power cable available for this unit, but Im not sure about using an external antenna. I have read that some people use two GPS antennas (one on the outside of the car, and one placed right on top of the GPS rcvr) and an amplifier in order to make external antennas for these style units. However, if all of that costs more than buying a new GPS with an external power and antenna jack then I will just buy a new one.

What would I need to get this off the ground? The radio and antenna are taken care of. Do I need to flash the Kantronics with the APRS firmware? Is it worth my time to use the GPS 38 I have (ie buying the other parts I need) or should I just buy a new one? Isnt there a "computer only" GPS receiver I can use? (ie, one that doesnt have a screen or anything, it just connects to the TNC). Thanks for the help guys.

>but Im not sure about using an external antenna.

If your way to school isn't too covered by trees or buildings, the GPS38
will do the job for you. It is a bit slow in getting a satellite fix,
but as soon as you have them, it will work all right (I have been
driving around with a GPS45 for a couple of years previously).
Fix a strip of velcro on the back of your GPS and on the place under the
windscreen where you want to put it; easy to remove.

I have been using my GPSs with a Kenwwod TH-D7 and nothing more (well,
yes, a power-and-NMEA-cable for the GPS and a power cable for the radio,
of course)

From: Rusty Coleman
Topic: 2304 Message: 2306

Hi and thanks for the input. My trip to school is down the interstate mostly so its perfectly clear to the forward and the back of the vehicle, and the trees to the side aren't too close. I have used the GPS38 in the car before. It set it on the dashboard so it has a nice view of the sky.

I *would* mount the GPS38 in some permanent fashion onto the dashboard but during the summer months here in South Carolina, I'm sure that thing would melt like ice cream. In order to mount the GPS in a more concealed location, I plan on using this http://www.gilsson.com/r-1.htm This is a re-radiator. Basically the external antenna picks up all the GPS signals it can see, and amplifies them slightly and sends them to the internal *transmitting* antenna. Its not really a transmitter, since the power on it is ridiculously low, but if your handheld GPS unit is within 20 cm of the internal antenna it works great. Also known as a passive repeater.

My TNC should be here today (in like 30 minutes or so) so Im excited about playing around with APRS here at the house before it goes into the car as a tracker.

>but Im not sure about using an external antenna.

If your way to school isn't too covered by trees or buildings, the GPS38 will do the job for you. It is a bit slow in getting a satellite fix, but as soon as you have them, it will work all right (I have been driving around with a GPS45 for a couple of years previously).
Fix a strip of velcro on the back of your GPS and on the place under the windscreen where you want to put it; easy to remove.

I have been using my GPSs with a Kenwwod TH-D7 and nothing more (well, yes, a power-and-NMEA-cable for the GPS and a power cable for the radio, of course)

I need a simple and cheap GPS unit to work with my TM-D700. What would this group recommend? I only want it to do APRS for me. Is there anything out there for $35.00 bucks? It does not need to have a screen on it.

Thanks for any help you may offer.

I'm a big fan of Garmin, so I would say for the money a $100 eTrex unit would be the best for the buck. But I also like Deluo's gps modules without screens. I have the older version, but this version would be fine for you. A little more than what you stated you wanted to spend, but the quality is worth the buck. You would only need to build a small power/data interface for this unit to provide 5VDC to it and then just run the serial data out to the D700.

Heres a link:
http://www.deluoelectronics.com/customer/product.php?productid=57&cat=1&page=1

Another option is a Motorola Oncore OEM unit. I like these alot and have several. I picked them each up for about $40. One catch, they put out serial at TTL levels, so a level converter such as the popular MAX232 would be required to put out the right serial levels for the D700. The Motorolas also default to their proprietary binary format and the unit requires it be programmed with WinOncore to put it in NMEA mode. In order to sustain this setting even after removing power, a 3V lithium battery needs to be added to back up the settings.

Good luck.

Here is what I use with my Alinco Transceiver.
Works pretty good.
It looks like a PC Mouse.

http://www.thegpsstore.com/Detail-Garmin-GPS35-Trac-Pak-receiver-for-PC.asp

Purchased mine from R&L for around $150.00 a few years ago.
Rather then modify the cable, I made a cable up to plug on the end of this cable to my transceiver.
So I can use it for APRS, or hook it to my PC as it was meant to be.

Rusty-
A couple of considerations. First, download an APRS software package and check to see if your route is covered by APRS stations. If there's no one listening and you are in hill country...your package won't help. In that case a cell phone and a service provider who covers the interstate (as most do) will be of more use. Or, an analog "bag" (3 watt) cell phone with no service plan, since they still work for 911 calls and they have more power and better range than any of the new phones.

<<It set it on the dashboard so it has a nice
view of the sky.>> I have the Garmin 12XL. I've used it on the dashboard and while it often works, I've also driven down 4-lane in wooded hill country and lost the signal for long periods because the sky view wasn't good enough. An external antenna really is best.

<<I *would* mount the GPS38 in some permanent fashion onto the dashboard>> Having walked away from accidents, I can tell you that anything which is not firmly affixed inside the car can and will become a missile, and then become junk, if you are in a collision or rollover. If that area is subject to fog or icing and any of those 50+ car pileups that some of the interstates regularly have...When you mount the radio AND the GPS, ask yourself if they really are mounted well enough to stay put and keep working in case you really need them.

<<but during the summer months here in South Carolina, I'm sure that thing would melt like ice cream. >> That's a problem with dashboards and older LCD displays in general. Putting a reflective "quilt" or sleeve over the GPS and display would help that, obviously you can put anything metallic over the antenna but it will see through fabric or foam without problems. If you use velcro to mount it, the velco adhesive also releases in extreme heat. 3M sells a special version for mounting on windshields, etc., where it will bake in the sun. (I don't know the name, you'd have to ask them directly.)

< I plan on using this http://www.gilsson.com/r-1.htm
This is a re-radiator. > That's an active repeater, not a passive one. GPSes use weak signals so it can be low power. But for the same $79, you can buy a whole new Garmin GPS18 "puck" which gives you state of the art antenna, sensitivity, and low power consumption all in one. Just mount it wherever you were planning to mount the gilsson! Or for the extra $25, buy an etrex (make sure it is a model that has a serial data port, the cheapest one doesn't) and you get a display and all too.

Hi and thanks for the advice. Yes I guess that re-radiator would be an active repeater, since passive repeaters are simply two antennas connected to each other, and active ones have some sort of amplifier or transmitter. This concept is very popular with cell phones, providing service inside buildings and tunnels.

I noticed that "puck" gps receiver in another thread. I looked them up on ebay but they are $115. Where can I get them for $79? Also the Etrex would still need a pc and power cable as well (on top of the price of the Etrex)? Does the Etrex have an external antenna connector?

You can get a Garmin GPS 18lvc for $79.95 from here:
<http://www.gpscity.com/gps/brados/077.2.12637835820499869512/oem18lvc.ht>
or a GPS 18pc for $84.95 from here:
<http://www.gpscity.com/gps/brados/44185.1.3474967628881950901/OEM18PC.html>

I have two of the lvc versions and they work great!

Rusty,

Here is another mobile GPS solution that might be helpful:

http://www.kd7lmo.net/ground_gps.html

It does require some hardware work, but then again that is half the fun of radio.

Hi all,

I want to set up APRS in my car and am looking for recommendations. I was considering getting a DeLORME Earthmate USB GPS device but wasn't sure if APRS supported GPS devices and can't seem to find a good source on the internet that says what works and what doesn't. I also want to use the GPS device with atlas and topo map software as well as the TravelPlus ARRL software so i can see what my exact 6 digit grid square location is for when operating as a rover during the VHF/UHF contests. Is there agood single website that has all the details I need?

I've been told that all NMEA compatible GPS rx will work great on APRS.
As far as translating this to a grid square map I'd like to do that
too. Anyone ave the UI-Digi Grid square maps for the US?

The Earthmate does not output NMEA sentences. It is Rockwell proprietary "Zodiac" protocol. This withstanding all you have to do is purchase a GST-1 interface and a little soldering and it works quite well. Very rugged and dependable. I have been using an Earthmate for 5 years and have not had a failure. But it all depends on what you want to do or invest in. At the time the Garmin GPS III was still pretty pricey and so where the others. However there are a lot of them on the used market so you just have to decide which way you want to go.

Hi all,

I want to set up APRS in my car and am looking for recommendations. I was considering getting a DeLORME Earthmate USB GPS device but wasn't sure if APRS supported GPS devices and can't seem to find a good source on the internet that says what works and what doesn't. I also want to use the GPS device with atlas and topo map software as well as the TravelPlus ARRL software so i can see what my exact 6 digit grid square location is for when operating as a rover during the VHF/UHF contests. Is there agood single website that has all the details I need?

Sounds good. I'll have to look into this GST-1 interface. I wanted to be able to use the Earthmate with the Street Atlas and Topo maps as well which I think will help when trying to find that new high location in a grid when operating as a rover during the VHF/UHF contests ;-). As well as be able to use it for APRS or HAM-IM. Thanks for all the information. I remember hearing about APRS and seeing it demonstrated 11 or 12 years ago but I never was in a position that i could set something up.

2320. Two mobiles in car

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-25 04:41:07 UTC
From: Rusty Coleman
Topic: 2316 Message: 2320

This isn't really an APRS question, not directly. I just ordered the Kenwood D700A mobile to put in my car, instead of using the Kantronics TNC (I want to send and rx text messages). But I already have an Icom 2720 in my car. I was going to put both in there, and run another antenna for the other mobile. But... even with the two antennas separated by the 3 feet or so on my trunk, they are still close, and keying up one on 2 meters would probably blow out the front end on the receiver on the other (either immediately or over time). Does that sound right to yall? I could put the other antenna on my hood next to the driver, but I don't really want an antenna on the front of my car, especially that close to the driver. Do you guys think one radio would damage the other?

Rusty

Hey Rusty, I am a Motorola radio tech at a local shop here in Roanoke, but I started off doing installs. I have also been called a muti-radio nutcase :o) So I MIGHT be able to help you out some.

First off, what kind of vehical? What is the distance from trunk edge to trunk edge? The reason I ask this is because you seem like a perfect candidate for fender or lip NMO mounts. Personally I prefer the fender mounts. If you are not familiar, they are simple L brackets that have a 3/4" hole for a standard NMO mount and usually 3 or 4 holes in the other half to be secured to the inside of the fender with sheet metal screws. These are nice because they can be mounted on both sides and the mount's upright part as well as the coax will fit nicely between the trunk's edge and the fender. Also, if you choose to remove them, you are only left with a few small screw holes that can't even be seen when the trunk is closed.

In the police car world, we're typically putting 2-3 antennas on a single trunk, usually 16" or less between each when 3 are used. They typically are somthing like: VHF or UHF, Low Band VHF and a scanner or CB. The low band is usually the issue since they typically put out 60-110 watts depending on the radio.

To make my point, I would'nt worry about putting the two dual bands together on the trunk. Just keep them at the distance that the trunk's edge allows and there should be no problem. Also, depending on the area, lowest power needed should always be the policy (and is the FCC law). For APRS I typically run about 35 Watts with a Motorola VHF Maxtrac mobile. I have 5 antennas on the roof of my S-10 pickup. If you would like to see some pics, check out http://www.ke4nyv.com/mobileradio.com I do get de-sense with the APRS radio, but only if I am on VHF voice, it doesn't affect me on UHF and thats what I typically use for voice anyways. My opinion on front ends is, if you can't have 50 watt radios within 5 feet of each other, they aren't worth a crap. But that again brings us back to using the least power required.

Both of the radios you described are 50 watt max units, so that is the most you'll have to deal with as far as desense. Both are decent radios and I think you'll be ok. I would suggest using high quality mounts, coax and antennas. Of course using two of the same antenna will look great as well. I suggest either Larsen open-coil dual bands or Antennex closed-coil dual bands.

Just my $1.25 but I hope that helps you out some.

From: Rusty Coleman
Topic: 2316 Message: 2322

I drive a Saturn SC2 and currently use a trunk mount NMO antenna. The antenna is a $12 "cell lookalike" dual band with pretty low gain. I chose that antenna for its low profile and it mimics the highway patrol 800 trunking antennas. I keep a big Diamond dual band high gain in the trunk in case I break down and I need just that little bit of extra gain to get a signal out.

Also I own two 440mhz repeaters so that is mostly what I use for voice, so APRS will probably not desense my receiver. My trunk is about 4 feet (guess, im a poor judge of distance and length) across. I would use another of the small low gain antennas for the second mobile.

Ahhh I just found this out that the new Earthmate that is USB based does support the NMEA format. Found that when looking at the GST-1 which is for the serial Earthmate(older model).

http://www.byonics.com/gst-1/

So I'm gonna go pick that up tonight so I can play and hope I can get it to work under my apple laptop running under Virtual PC. Should work. Still thankyou for the information.

2324. New SW Virginia APRS Board

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-25 20:43:24 UTC
From: J. Rausch
Topic: 2324 Message: 2324

If anyone on this list happens to live in the southwest region on Virginia, we have a new message board for you to use. This is not a Yahoo board. I am abandoning the old Yahoo board due to most members leaving for outside spam reasons (not messages sent directly in the reflector). We now have a private, spamless board.

We are not limited to just SW Virginia users, hams in neighboring states may wish to join to "keep in contact".

The board is located at:

http://www.radiocommunication.com/swvaaprs

Thanks,

2325. KPC-3 Plus/Weather Station

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-26 04:45:50 UTC
From: John
Topic: 2325 Message: 2325

I have a KPC-3 plus tnc and running UIView for APRS. I also want to tie a PeetBros 2100 weather station into it. I have been led to believe the KPC-3 Plus can be used for this also, only problem the tnc has only 2 ports, one for the transceiver and the other for the computer so I don't see how I can use the tnc for a weather station as well since both ports are used.

Anyone have any information regarding this?

Thanks
John/N0MEQ

2326. Logging software

Hi all.

I am putting together some software to log APRS data for me and I am looking for a email server that I can send emails to and get callsign info back for callsigns in Australia?

Alternatively a CGI type server that simply sends basic info and not all the web page etc.

What I am trying to do is log reception areas of various repeaters etc...

Regards, Peter

Connect the weather station to the PC. UI-View will send it to the TNC.

Dave, the new Earthmate (sometimes informally called the Earthmate2 to distunguish it from the older unit) is not just USB. It has USB and serial support on board. DeLorme only seels it with the USB cable, but all it needs is the optional serial/power cable to be used as a serial GPS. Or, you can use the existing USB cable and solder to the appropriate pinouts that are in it. (DeLorme of course will not support soldering.) Pinouts are in the "Secret GPS documentation" folder in the Yahoo! TinyTrak group.

Thanks for the input ;-) I am going to go pick it up tonight so I can play with it and the software on my laptop. My intention is to set this up on a dedicated computer in my car to a 7" touchscreen display. That way I'll have internet(via my cell phone), aprs, navaigation, logging(for VHF/UHF Contests) and much much more.

2331. Re: Two mobiles in car

Yahoo group: APRS (1998 — 2006)
Date: 2005-01-27 21:42:52 UTC
From: KI6LO
Topic: 2316 Message: 2331

Rusty,

I run a Kenwood TM-G707A VHF/UHF, a Yaesu FT-1500M VHF and a FT-100D HF/50/2M/440, all in the trunk of my 2001 Mitsubishi Galant ES. The FT-100D and TM-G707A heads are installed in and on the dash. The FT-1500 runs up to 50W on APRS when I'm way out in the boonies, usually on mid power (15-20W??). Other than a momentary desense on the TM-G707A RX, there is no ill affects.

I use a Diamond dual band on the drvrs side of trunk for the TM-G707A, an ATAS-100 on the psgr side of trunk hooked to the FT-100D, and the APRS setup uses a MFJ dual band mag mount on top of the psgr cabin. All works great with no problems. I usually keep the FT-100 on HF (20-17M) and the TM-G707A is on the local 64 rptr with the APRS on 144.39 running whenever I am mobile.

Hope this helps.

Hello to the group-

I am putting together a portable APRS station. I have a laptop with Win98se, Garmin GPSIII, Alinco DR-135 with TNC build in. I will use the station for general APRS use and also ARES/RACES and Search/Rescue usage.

There are lots of software and mapping combinations I could use. I have asked a few folks and they say APRS+SA and SA7. Is that a good choice? Any other ideas.

Thanks for the help.

I use UI-View32 and Precision Maps 7 and think it is
great! Check out www.uiview.org for more info.

Well after testing I found that I couldn't get the Delorme Earthmate USB to work under Virtual PC on a mac due to some weird incompatbility in the virtual usb drivers but that's ok since my plan is to install a Windows XP based PC in the car for it's use anyhow. I did test it out with the software it came with on a friends laptop and it works superbly.

From: D Summerhawk
Topic: 2334 Message: 2338

Question:
Are you going to be using this for stationary operations? Or are you going to out in the field with the team? Stationary operations I would say go with the laptop, but for foot ops I would say get a used palm or Ipaq off ebay and load either pocketaprs or aprsCE and run it from there.
The laptop in the car is a good way to track teams in the field and UI-view is what I use. I also have county maps from each state zipped on cd and can extract them when I need to for county searches.

2339. APRS without a TNC?

Yahoo group: APRS (1998 — 2006)
Date: 2005-02-01 02:39:11 UTC
From: Jason
Topic: 2339 Message: 2339

I'm interested in being able to receive APRS data and being able to have the station location display on a map without needing a TNC. I read in ARRL's APRS book, there are soundcard programs that can emulate a TNC. Is anyone doing this?

Also, thanks to the group's suggestion on a basic setup for my truck, I went with the Tinytrak 3 and it works EXCELENT! I Hooked it to an old Kenwood HT-225 that was destined for the trash (broken display and parts scarce) and I am impressed! Does what I need it to do!

Thanks for the help!

I have used two programs for the soundcard TNC solution, AGWPE and Flex32, both will work with UI-View 32 which is what I use for the APRS program.

AGWPE and Flex32 are free, UI-View 32 is now free but asks an optional donation to the cancer charity of your choice. There are probably other programs, but these are what I have used. The links below will take you to information with links to download the software.

From: va6mjt
Topic: 2334 Message: 2346

I user UI-View as well as one of the other individuals mentioned in the thread of your note. I am not too familiar with all of the other piece of software available for this but have become fairly found of UI-View. I also own GPS maps of North America and they are very detailed. During Xmass time I tried my hand a creating maps. I have each state of the US and each province of Canada on my website for grabs to other APRS'ers. I find making the maps now only takes me a few minutes but you need a good source to get them from. I tried working with Microsoft Streets and Trips 2005, I would not recommend this for distance maps and I can explain why if your interested but you can let me know. I found that Mapsource was the best solution which again I will explain if anyone is interested.
If you would like the maps I created they are on my website please feel free to grab them. If you have certain areas you would like let me know and I help if I can.
I do not know if UI-View maps are usable with other APRS software since I am only new to the APRS scene. I guess they would be the same because you need to specify the coordinates for that image and I am certain they all read that same style of info.
Here is the link to my website and look off on the left side bar there us a link for UI-View Maps. They are there for that reason. I will make more as I need them but will help anyone else that is looking for an area of maps as well.
http://www.qrz.ca
I can be e-mailed from the website or va6mjt@.... Hopefully I can help somone out if possible.
de Mike

From: Kelly
Topic: 2348 Message: 2348

Hi all;

I'm a first time poster to this group. (thanks mr. moderator).

I'm interested in putting on an APRS station. I don't know
what type of station to put up -- digipeater, or I-gate-- if a
station is even needed here.

Other than one digipeater eight miles away, I don't what else is
nearby. And, I don't know how to find out.

I have:

A location within view of the interstate (I-40, exit 127, Arkansas);
A 2m/440 rig (no TNC,--suggestion?);
an antenna up 35 feet;
always-on internet access;

How best can I help?

(You're welcome to contact me off-list, also).

From: Bob Bailey
Topic: 2348 Message: 2349

The first thing to do is contact the operator of the closest Digipeater in your area and find out from him how you could assist the APRS systems in your area. Give him a sense of what you plan to do it terms of equipment and your expected coverage you would be able to provide. My bet is a good 24/7 Igate is what would be welcome in that area.

The last thing you want to do is just throw a system up without any regard for what the current infrastructre is as quite a bit of expense,planning and labor went in to what is now up and running and a duplication of what is already available with no hope of furthering the coverage already is a waste of everyones time as well as resources. Your area has a great many high points to offer. MTMAG and Magnet already are very useful and probably could use a little more form a smaller coverage site such as what your may be able to provide.

At any rate feel free to tap me for more at mdrdg@... Bob KA?MR

Hello Bob,
I have a question. How could you use APRS to send MARS EEI's.

State Mars is looking to get EEI's from the field to HQ. Other than using a caned system like ARRL numbered messages, then have a local station decode the messages into an EEI format. We are getting ready for a drill using APRS to track Supplies and resources. Any input would be apriciated.

2352. Re: [APRS] Digest Number 734

Yahoo group: APRS (1998 — 2006)
Date: 2005-02-15 14:20:33 UTC
From: Kelly Boswell
Topic: 2352 Message: 2352

Bob;

Thanks for replying.

I suspect you are correct that an Igate would be helpful here. The reasons you gave (in your second paragraph) are why I posted my message--no need to spend the money and effort to produce something that doesn't help.

Any suggestions on how I find the nearest digipeater, so I can talk to the owner? I have one neighbor who turns on his home-station APRS for a couple days at a time (map.findu.com/ae5gh). I've talked with him before posting my original message. He knows of no "digi" nearby.

sorry to sound so "newbie" at this. But, as we've said, I sure would hate to get stuff together and learn that I had blundered into something that duplicates what exists, or worse, qrm's something that's already working.

Perhaps we can chat off-list.
73,
Kelly

2353. Newby Questions

Yahoo group: APRS (1998 — 2006)
Date: 2005-02-19 13:31:31 UTC
From: galway_traders
Topic: 2353 Message: 2353

Hi I new to this whole area of aprs and have only researching it for a couple of
days.

Already i'm interested in investing in equipment but am unsure on what to get. I
have no equipment at present except for a pc and laptop.

Being a student, value is the key!

My idea is to track a car in real time using radio communication.

From what I understand I need
In the car:
A gps transender
A terminal node controller
A packet radio transmitter

At the base station:
A packet radio receiver
Cables to connect this to the computer

Software? WinAPRS

Like I said i'm a newby
Its been suggested to me to start off with a
TinyTrak & PocketTracker from http://www.byonics.com/

Any ideas about equipment, I probably have picked the wrong stuff.
Any help would be gratefully appreciated

Hi, well first off, I have to ask, are you a licensed ham? You did'nt refer to a name or call and I always have to ask.

Well, you are part of the way there.

For a vehical, you would need a GPS Receiver capable of outputting NMEA SERIAL data at 4800 baud, A full TNC in no longer needed for a tracker, the Byonics TinyTrak III or N1VG OpenTracker works great for this and the radio can be any 2M FM transceiver that is for voice or data. You can get away with TX only boards, but that can be disasterous in a busy network with too much power and no way to determine that the channel is busy. You want to always prevent collision.

> At the base station:
> A packet radio receiver
> Cables to connect this to the computer

For a home station you would need a computer, TNC and another 2M FM transceiver.

> Software? WinAPRS

Sure, WinAPRS, UI-View for the windows machines. DosAPRS for DOS machines. You have XASTIR for Linux and PocketAPRS for Palm OS devices.

> Like I said i'm a newby
> Its been suggested to me to start off with a

> TinyTrak & PocketTracker from http://www.byonics.com/

The TinyTrak III is a great way to get started. I also sell TinyTrak III's prebuilt and the radio/gps interface cables at www.rpc-electronics.com

I also recommend Scott Miller N1VG's OpenTracker. The OT is capable of APRS as well as the OpenTrac protocol. Check out www.n1vg.net

From: Martin Maxwell
Topic: 2353 Message: 2355

The best and easiest way to do it is to get a D700 by Kenwood, and a GPS to hook to it. The radio does it all for you once its set up. Mobile or base either way.

Martin

What do you think of this
http://www.eham.net/reviews/detail/1020

I understand just the basics of radio! I want it to cover an area of
at least 5 miles in a non built up area! In that case I presume a less
powerful radio than a 2M FM transceiver might be needed.
What are your thoughts on that

> For a home station you would need a computer, TNC and another 2M FM
> transceiver.

I have got information to suggest that it is now possible to skip the
tnc and feed the audio from the base station directly into my computer
and letting software decode it.
Do you know of any radio models which would suit that purpose

The kenwood D700 suggested by martinmaxwell85224 is an enormous
amount
of cash that I don't have available

I greatly appreciate your help
u seem to know what your talking about

Many thanks
kieran83

```

I use the Garmin GPS18PC. You will need either the PC or LVC model depending on how you want to power it. I use the PC version with a laptop as it come with the 9 pin serial plug and a voltage regulator in the cigar lighter power plug.

```

I use an HTX-252 for my home packet transceiver, in my mobile I use an HTX-202 with a 25W amp. If I had another HTX-252, I'd use it in the mobile. There are better radios but if you have one or can get one cheap they work.

```

For 5 miles over flat land 5W might be enough 25W would be more reliable.

```

Almost any transceiver will work including the HTX-252 with a suitable power supply.

Either AGWPE or Flex32 will work with UI-View to give you sound card APRS.

Kieran-
The TT3 can be used with pretty much any radio. Getting reliable communications over a 5-mile range is another matter though. And the type of radio (2M, etc.) will also be limited by Irish radio laws, which will allow certain types of communications like APRS on certain frequencies for certain license classes only. I have no idea what the legalities are over there.

Generally VHF radios have a line-of-sight range only, which is about 3 miles for a VHF radio to the local horizon, assuming that both stations (tx and rx) are at the same elevation with a handheld antenna, or otherwise equal. There are equations to determine range versus antenna height, which also affect this. The range increases as both antenna heights go up. That's one issue.

Another is background noise. The 250mW PocketTrack is "enough" for a range of 50 miles or more--if there is very low background noise, if there are no stronger signals to knock it out, if the antennas are in sight. For two stations on the ground, 1/4 mile is more of a practical number. I'd tend to agree with the other recommendations that 5W might be enough, 25W would be more likely to be reliable, and I'd also use 25-50W if I wanted to be sure. That's also assuming you optimize the antennas and antenna locations at both ends, a good 1/4 wave or similar on both ends. Yes, less may work just fine. There are just a lot of "it depends" when you want reliable communications in the field though. Be patient, reaed up and ask around on those issues, and you are more likely to get the equipment right the first time.

2359. Inexpensive Small Low Power APRS TNC

Yahoo group: APRS (1998 — 2006)

From: kc8uir
Topic: 2359 Message: 2359

A project I have been working on for some time is now available. I have been building a TNC using an Atmel microprocessor. It is lowpower and designed for APRS usage. It has a limited TNC command set just most of the important stuff for APRS. It has direct GPS connectivity and Charater LCD support. The best thing about it is the code is all Open Source so anyone can customize it to their own needs. All that is required to download new firmware to the TNC is a computer with a serial port.

Check it out on my website http://www.burrotech.net/hamradio/avrtnc32

2361. RE: [APRS] Re: Newby Questions

Yahoo group: APRS (1998 — 2006)
Date: 2005-02-20 16:27:44 UTC
From: Brian Davies
Topic: 2353 Message: 2361

Hi Keiran

Most of the Garmin range of GPS modules will do the job, there are one or two that don't output NMEA and these won't do.

Any 2m FM radio transceiver will do the job, for a 5 mile radius across open country, note no hills, 5W is adequate so the radio you suggest will be fine. Bear in mind that the radio you suggested is for the USA licence requirements and you will need to check that these meet the requirements in Ireland, they don't meet those for the UK

Yes you can feed the output of the radio rx direct into the PC by using an interface program like AGWPE or AGWPE PRO. You send the input via the sound card. AGWPE is a free program, AGWPE PRO requires registration.

The best APRS program I've ever used is Ui-view32. It is readily available for the price of a donation to any cancer charity. Both AGWPE and Ui-view have a group on Yahoo and it might be worth subscribing to these. Note that these programs are not available for commercial use.

Hope this helps

I AM NEW TO THE INTERNET SIDE OF APRS AND HAVE ONLY LIMITED APRS EXPIERENCE. I LIVE OUTSIDE OF SIOUX CITY IOWA WHERE THERE IS A BIG GAP I PLAN TO FILL WITH A APRS DIGPEATER. I HAVE SPENT THE TIME AND THE MONEY (ALOT) TO GET A COMPUTER, HARD WIRE IT TO A CABLE MODEM HUB AND RUN THE WIRES AND SO FORTH. SO I AM DEDICATED TO THIS BUT NEED YOUR HELP.
HERES THE DEAL:
1.I HAVE STREETS AND TRIPS 2005 AND WANT TO USE THAT WITH MY APRS. HOW DO I DO THAT OR WHERE CAN I GO TO GET THE PRINTED MANUAL FOR THIS?
2. I AM USING A KANTRONICS KPC-2. WHAT ARE MY LIMITATIONS?.
3. I DONT BELIVE THERE IS A MAILBOX WITH THIS KPC-2. CAN I USE THE HARD DRIVE ON MY COMPUTER TO STORE THIS TYPE OF INFO?.
4. HOW TO I COMBINE NOT ONLY THE DIGIPEATING SIDE BUT ALSO THE INTERNET SIDE OF THIS VERY WONDERFUL SYSTEM?. THIS IS GUNNA BE DEDICATED 24/7.
5. I WANT TO LEARN AND HAVE PRINTED SO MUCH STUFF THAT I THINK IM GETTING OVERLOADED WITH SOME POSSIBLE BAD INFO. ID LIKE TO BE ABLE TO GET IT UP AND RUNNING AND THEN READ ALL THE FINE PRINT STUFF.
I HAVE BEEN A HAM FOR MANY YEARS. IM CURRENTLY DOING EMS AND FIREFIGHTING AND WAS A RED CROSS COMMS OFFICER FOR QUITE A LONG TIME. MY GUYS ARE INTERESTED IN SEEING WHAT THIS SYSTEM CAN DO. I ALSO BELIVE THAT I CAN GET SOME OF THEM OFF CB AND INTO HAM RADIO BY DOING POWER POINT PRESENTATIONS AND THE SUCH TO THE SURRONDING AREAS.
I KNOW YOU GUYS ARE BUSY BUT ANY INFO THAT YOU HAVE WOULD BE GREAT.
ALSO, IS THERE A WAY THAT I CAN PRINT OUT THE STATION INFO AS I RECEIVE IT WITH A DEDICATED PRINTER. ID LIKE TO USE ONE IF APRS SUPPORTS IT.
SO FAR I HAVE HEARD THAT APRS+SA IS THE BEST FOR WHAT IM DOING. BUT YOU GUYS ARE CLEARLY THE EXPERTS.
I WILL CHECK THESE MESSAGES BUT YOU CAN GET ME ON YAHOO AS WA1EMT OR YAHOO MESSENGER.
THANKS SO MUCH FOR YOUR TIME.
THIS MESSAGE WILL BE POSTED ON A FEW OTHER GROUP FORUMS SO THAT I CAN GET AS MUCH INPUT AS POSSIBLE
THANKS,
WA1EMT
WILLIAM.

I'd think that before you get your licence, you'll have to achieve a
little more than just the basics of radio.

When you have become your licence, you'll probably wish to see other
radio amateurs from your neighbourhood, so you might want to join a
radio club, e.g. tha local branch of Ireland's amateur radio
association. There, you'd probably get help in many aspects of amateur
radio, and more easily than in an email forum.

William,

I do not know anything about Street and Trips so I can not help with that.

I use UI-View with Undertow Software's Precision Mapping 7. Undertow is here: <http://www.undertowsoftware.com/?AID=9>. UI-View is here: <http://www.ui-view.org/>. I would think that it will work fine with you KPC-2 if you put it in KISS mode. There is a Yahoo group for UI-View that you may want to subscribe to.

I see on my map that WB0WNX appears to be on APRS near Sioux City.

Rusty.....

Probably no dammage but run your radios at the lowest power possible.

I find no advantage to running high power on APRS in my driving around Los Angeles. I have made nine trips to and from LA and northern Washington on I-5 in the last year and find high power of no value. I have tested 5/8 wave and 1/4 wave antenns with 50W and 5W. Breadcrumbs indicate no diference in coverage on this route.

I have settled on running 50W to a 5/8 for voice which is usually on the upper two MC of the band and 5W to a 1/4 wave for APRS. These antennas are on the top of a van at a distance of about five feet. I'm sure there is desense on APRS but it seems to have little impact on it's operation. I seldom notice anything on voice.

Wayne, WA6MPG

This is William, WA1EMT. Thanks for your reply to my email. I have a serious issue:
The output for the kpc-2 is db-25. I hooked that cable to the only db-25 on the computer. Within 3 minutes the power wire to the kpc was hot as hell and so was the data cable to the computer.
No magic smoke was seen and the power light comes on and everything looks good.
What did I do?.
I then hooked the kpc to the compute with a db25 to db-9 cable. Can I do that?.
Anything you can do would be great. Im 1 step away from getting on the air.
Thanks,
William

2369. Re: [APRS] TNC hookup help needed. Hot wires

Topic: 2368 Message: 2369

Sounds like you took a 25 pin serial cable and plugged into the parallel LPT1 port on the computer instead of using a 25-pin to 9-pin converter and plugging it in to the correct COM port.
Probably KPC is ok.

2370. Precision Mapping 7 & WinAPRS 2.7.7

Yahoo group: APRS (1998 — 2006)
Date: 2005-02-27 16:34:53 UTC
From: Chris McCormick
Topic: 2370 Message: 2370

Hi all,
I'm a new user of WinAPRS v2.7.7, and Precision Mapping 7; WinAPRS reports that I must register PM7 on my machine before WinAPRS can use it. I purchased and installed PM7 (works ok with UI-View32 and PMServer 7)... what did I leave undone? Or doesn't WinAPRS 2.7.7 support PM7? Any help would be appreciated.

Chris / N3JHR

2371. Re: [APRS] Precision Mapping 7 & WinAPRS 2.7.7

Topic: 2370 Message: 2371

I beleive they dropped PM support in the last major revision because of the slacked off demand for it. With Tiger map files readily available for free, who needs PM? I do however use PM7 with UI-View32 and I love it. I have a legitimate copy of PM7 and after running it for about a week, all of a sudden it came up and asked for verification of purchase. At that point I had to go to the PM website and enter in my information to get a reg. key. Once I put that in, everything was ok.

The db-25 to db-9 cable is probably the correct one if it is a modem cable. TNCs hook up to the computer just like an external telephone modem.

Jason-
<With Tiger map files readily available for free, who
needs PM? >
As the nice folks at the Census will tell you, the Tiger maps are not
designed for mapping or navigation. They are for population demographics
only and in some areas they are grossly inaccurate compared to USGS and
other cartographic sources. In the NYC area, the TIGER maps through 2003
were all off by some 200 yards (2 city blocks) because they were based on an
oddball NYC mapping datum which was never corrected when the Census used it.
IIRC with the 2003 maps they corrected one county but not the other
four--leaving discrepancies within the city--along with something like
50-100 other counties in the US.
In some areas the TIGER maps may be dead on (and the Census would like
them to be dead on, but they have no budget for this) but as repeated posts
from puzzled APRS users show, the Tiger maps are a bad source if you are
looking for anything better than a rough position.

Yes, you are right about the marginal accuracy. BUT, the average ham is too cheap to buy the PM CD's. I know the Sproul brothers from meeting up with them at various Daytons and DCC's and discussed this with them some. The explanation I got was just that, hams are cheap and they want the free route. The only reason I have PM6 and PM7 is because I won then in a door prize drawing at the 2004 Dayton APRS Pizza lunch.

I'm a bit confused by your question.... The encoder just needs a data stream from the GPS... How the encoder gets the information doesn't matter. Which encoder are you using? PC Based (UI-View, APRS+SA), or something like a D700, or perhaps a TinyTrak, or what? We can probably assist you in getting the data from the receiver into whatever encoder your using if you can give us a sense of your setup...

Eric:
I'm at the basic startup position. I have a Holux GM210 receiver with a USB plug on the end. I am looking for an encoder to use with my Icom 02AT tranceiver, to place myself on APRS locally.

As a side benifit, if I could also use a in vehicle mapping system to show my route it would be a big plus, but not absolutly necessary.

I e-mailed TinyTrak and asked them if their unit would accept the input from my USB cabled GPS and they said no.

Do I have the setup right???

///GPS Receiver///----///Encoder///---///Tranceiver///

or, could a computer be placed in line between the GPS and the encoder?

I'm new at the APRS/GPS world, although fairly competent in both Ham Radio and Computers

Any help is appreciated.

2378. Re: Encoder for USB Receiver

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-03 21:25:32 UTC
From: KI6LO
Topic: 2375 Message: 2378

Jerry,

What you hae is a GPS rcvr that is designed to talk to a USB port on a PC or laptop. USB is in essence a one-way device even though it 'talks' bidirectional. The hardware for the USB is in the Holux USB port (or cable as it may be - don't anything about Holux rcvrs) and the 'smarts' for the USB to PC conversion is contained in the software driver that is loaded when you install the GPS rcvr the first time.

There isn't a way (or at least that I know of off the shelf) that you can hook up a USB driven device (such as your Holux) to such a device as a Tiny trak or a TH-D7A since these devices are designed to speak simple serial (essentially basic RS-232 serial protocol).

Until someone decides to invest the time and energy into a smart standalone interface device that can take USB in on one side and talk serial out the other WITHOUT the need of a PC, I'm afraid we're out of luck in that dept.

The USB to serial converters that everyone talks about simple is an extension of the problem since the USB side of the convertor depends on the USB driver software to execute on the host PC. The converter handles the hardware level conversion and passes data to the serial port on the 'output' of the converter, hence my original statement that the USB is essential a one way device, in as far as the I/O hookup goes. At least with the old 9 pin serial connections, a bit of tweaking and almost any serial device could talk to any other serial device (at least at the hardware level). That is why the older non-USB GPS receivers are great for hooking upto non-PC applications such as APRS trackers, etc.

Hope this helps you.

I seem to recall from my old KAM days, there is a voltage (12v?) on one of the serial port pins on Kantronics devices. An I expect you hooked up the 25pin to a parallel printer port on the PC. Not a good thing to do, hope you didn't cook anything inside. Smoke is usually the final insult from hardware just before it dies.

Save the Holux for your laptop-based auto navigation system
and get a Garmin GPS18 for APRS.

To quote WA8LMF's writeup on USB...

>USB devices have a master/slave relationship with their host. They
>depend on a complex, multi-layer assembly of driver software and
>operating system support to even aquire an identity, let alone talk to
>the master. The requirement for device-specific drivers pretty much

>unique driver requirements are appearing constantly, such a converter
>would have to have some means of adding new firmware, assuming the
>vendor had the resources to constantly develop the new drivers.
>
>Stephen H. Smith wa8lmf (at) aol.com

Best bet is a Garmin GPS 18....
comes in several versions:

1) the USB version does NOT put out NMEA 0183 data... only in GARMIN mode.
OK for mapping programs that understand GARMIN host mode, but pretty
useless for APRS.

2) the "PC" version has a 12V cigarette lighter plug (with a built-in power
supply) and a DB-9 female connector to plug into a laptop serial port.

3) the GPS18LVC (without power supply and connectors) - requires +4.5 to +5.5v in at about 60ma and outputs serial. And the drawing in the manual shows a car battery, implying it's a +12 device when in reality it's a +5v device.
Actually the GPS18PC is also 5VDC...BUT it comes with a 12 to 5 VDC regulator IN THE CIGAR-LIGHTER PLUG! If you cut off the cigar-lighter plug you will also have cut off the 12 to 5 VDC regulator.

www.gpscity.com sells the Garmin GPS18PC for about $85, and the GPS18LVC for about $80

Another source of the GPS18 is www.gps4fun.com
and a third is http://www.gpscentral.ca/products/garmin/18.htm

the Garmin spec sheet says they'll support immersion to depth of 1 meter for one
minute.. That's close enough to waterproof for many applications.

If you get a GPS18 to dedicate to your APRS applications you will want to download and install the GPS18 configuration software (Snsrcfg.exe) so you can tell the 18 to output only the minimum sentence info at the proper baud rate and so on. There are a bunch of options for the 18 and you have no idea what the configuration is currently set at until you check it out.
You may have to make up a cable to hook the GPS18LVC to your PC serial port, and once you get it working you might also want to update the firmware. You must be in GARMIN mode to update the firmware.

2381. TNC hookup help needed. Hot wires. Issue resolved

From: andy_watson5
Topic: 2382 Message: 2382

I've got several TinyTraks, but I'd like to get a real TNC to connect to my computer so I can see live APRS in my area. I've got Windows XP, and I like UIView. What make/models of TNC's can I use? I'd like to use the cheapest bare-bones APRS-capable TNC. Any ideas?

For a fixed position station just about anything will work. I've had good luck getting used MFJ 1270 TN C's at hamfests etc for around $30-40. Older KPC-3's (not the plus) are usually pretty reasonable used as well.

You can also get software (AWGPE) that will let you use a soundcard as a TNC. Not that familiar with it but a google search should give you plenty of information.

It's when you want to run a mobile tracker with GPS input that it gets more complicated.

Good Luck

Dont go bare bones unless you have too.
KPC-3+ and the KPC 9612 are awsome.
Never short out your options

I picked up a used Kantronics KPC3 (not the +) for about $50 at a hamfest.
Its running great with UIView.

As long as you have a PC program running it, its OK. It is lacking in
internal APRS commands, so you could not use is as a stand alone APRS tnc.

That being said, if you can swing it get the KPC3+. Its far more versital
and has a few more whistles and bells.

I asked this question over on the TinyTrak group,
and thought I'd run it past the APRS group and
see what responses I get.

I have a 16 Channel Phoenix SX on VHF and
would like to program it for use on APRS as a
dedicated radio.

So far I have the following gathered:

144.390 Of course
145.790 found it is used in parts of CA.
144.990 Proposed "Low Power"
145.01
145.03
145.05
145.07
145.09

Any additions ????

Thanks
Robert - WA6IJD

From: Al Allum
Topic: 2391 Message: 2391

Subject: Inexpensive GPS units

Hi. I am interested in getting into APRS reporting and have 2 meter ratios and a laptop, however, I do not have a GPS unit. When I surf for them I come up with expensive units and no mention of any output.

What are your ideas of a GPS unit that is:
cheap but dependable
proper output
make, model

An equipment list might be a good idea of a file in the file section for beginners.

Thanks for your help
Al, N8ARO Romeo, MI

From: andy_watson5
Topic: 2395 Message: 2395

Apparently you can connect certain mapping Garmin GPS units to a Kenwood TH-D7A, and it will display the positions of other heard APRS stations on your GPS's map display. Is there any way to do this with a regular transceiver with the help of some kind of special TNC or interface?

2396. Garmin GPS II Question

A TNC with a serial port will cooperate with your GPS in the same way. Data Out from the Garmin goes to Data In at the TNC Serial port, and vice versa; common on the GPS end is Ground on the TNC end. It's a good idea to have a power/data cable for the Garmin, so you can power it from an external source without having to change cables.

And the wiring of the radio and the TNC will be a matter of making a speaker/mic plug and connectors for the TNC end, like in other radio/TNC setups.

2402. New KPC3 Plus

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-07 05:47:41 UTC
From: kg4pid
Topic: 2402 Message: 2402

Hello, my name is Max KG4PID and I'm new to the group. I've been playing with APRS a little over the past 6 months. I have a couple of TinyTrak3's I've been using but the coverage I my rural area is very poor so I purchased a KPC3+. I think for now I would like to set up an IGATE and I have DSL and a spare PC available. I searched the web for setup info and programs to run but not knowing anything much about all this I'm still lost.

Where is a good source of info for a beginner? Also is there any problems running the Igate behind a router and firewall. I can open up any needed ports, but I don't know whats used. If I'm thinking correctly I don't need to setup as a digi because that adds to the congestion. I just don't want to set it up incorectly and cause problems.

Thanks in advance
Max

UI-View 32 is easy to set-up and it is now donation ware, i.e. registration is free but a donation to a cancer charity is suggested but not required.

http://www.ui-view.org/

A registered version of UI-View will allow you to gate APRS to and from the internet. A true IGATE goes both ways, but UI-View will allow you to gate RF to the net or the net to RF or both.

I gate RF to the net and I don't have APRS transmit at the house. I have a dsl connection and a four port router and software firewall and have no problems with that.

If you have a spare PC to use for the application, you don't even need the TNC. You can use the soundcard and AGWPE or Flex32 to receive the packets and save the TNC for other packet work.

There is a yahoo group devoted to UI-View if you decide to try it.

2409. RE: [APRS] ui-view and precision maping on win xp

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-12 15:03:16 UTC
From: N9WYS
Topic: 2405 Message: 2409

Make sure you're entering LAT/LON in degrees/minutes/decimal minutes into UI-View. The format is XX.YY.ZZZN (for LAT) and XXX.YY.ZZZW (for LON), where XX is degrees, YY is minutes, and ZZZ is >decimal minutes<. (NOT seconds!!) I use all three digits in the LON entry. For example, my station location is: 41.26.46N 088.14.80W. (Sorry - I'm currently off the air with an antenna problem.)

I hope that helps.

In Setup, Station Setup, enter the latitude as degrees dot
minutes dot decimal minutes N and longitude as a 3 digit degrees
dot minutes dot decimal minutes W.

Mine is entered as 43.45.65N and 088.26.18W . For a better
explanation just press F1 while you have the station setup
window open. UI-View help is pretty good.

I think what you are missing is this

My location (from my GPS is 39.92392 N 121.78800 W)
to put this into ui-view, you need to multiply by 60
I already have the 39, so .92392*60= 55.43 so I enter

39.55.43 N When I get to the next part I enter

121 then multiply .78800 * 60 = 47.28 or 121.47.28 W

Hope this helps

Dan

2412. should I use MIC-E?

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-13 00:24:06 UTC
From: andy_watson5
Topic: 2412 Message: 2412

I've been away from APRS for a couple years, and I'm getting back into it now. I've got 3 TinyTrack2 units that I've resurrected back into working order, and I'm listening to the local digipeaters with my soundcard and AGWPE. I've noticed that the majority of people are sending MIC-E format positions now. I know they're shorter than the standard APRS format. But I thought I remembered seeing something about problems some stations have when receiving MIC-E formats. What's the latest with MIC-E? Should I enable all my TinyTracks to send MIC-E now?

If I'm not mistaken the GPS NMEA format is already in
degrees, minutes and decimal minutes so your location would be
39.92.39N and 121.78.80W as entered into UI-View.

Yep, you're mistaken. NMEA format has nothing to do with it.
As all the previous emails said, it's Degrees.Minutes.Decimal Minutes.

No such thing as 92.39 minutes, or 78.80 minutes.

From: Ken Hanks
Topic: 2382 Message: 2415

You could also look at the uTNC (micro TNC) from Elcom in Greece " www.elcom.gr" I bought one of these units and they are small (approx 2.5 x 1.5 x .75)! They have a built in battery pack, built in voltage regulator to run if from the car or powered thru a USB port (also for programming). They are APRS compatible, will run as a full 1200 afsk TNC, DIGI, or stand alone tracker. Shipped $114. Expect to wait several weeks to receive this in, customs between Greece and the US is really slow!!!. Love having this thing load up APRS stations automatically as waypoints into my Magellan GPS Map Pro.

The most unique and small and all around TNC, IMHO.

Topic: 2416 Message: 2416

Precision mapping quick finder version 5..is this useable?
If I dont want the newest version..what other versions can I use.
Also, why cant I zoom when I make my own maps with streets and trips
per the instructions on how to do it?
I figure that I can use the earlier version of Precision Mapping and
I might find it cheaper.
What do you guys think?????
Thanks

2420. Need suggestions

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-15 18:08:28 UTC
From: Edmund F Leavitt
Topic: 2420 Message: 2420

I'm minimally familiar with APRS. Our amateur station at an EOC contains APRS, with a KPC3+ for a TNC. We recently changed out a troublesome KPC and the system no longer posts positions of stations it hears. It appears to be some sort of flow control issue.

I have done hard and soft resets on the KPC. The TNC accepts commands from the APRS software, though I get very little obvious feedback visible in the APRS terminal window. For instance, if I type RESTORE DEFAULTS <CRLF> I see the autobaud routine execute. After entering a callsign I see no more characters in APRS's terminal window. But the TNC still seems to be listening to the serial port. If I get frustrated and RESTORE DEFAULTS again (assuming that I remembered to set INTFACE = TERMinal) it happily starts the autobaud routine again.

Here is why I suspect a flow control problem. If I open the VHF port and let it listen on frequency for a minute, and then close APRS and open a simple terminal emulator program, I get a dump on the screen of everything the TNC had in its buffer.

Any hunches what I am doing wrong?

From: Jason Rausch
Topic: 2420 Message: 2421

Start with a hard reset, then in HyperTerminal set the settings to 9600 baud. Turn on the TNC and press Shift+8 (8 is the asterik key) This will then ask for the callsign. Enter in the callsign. At this point you are talking at 9600 baud. Then do the command: int term This puts you in Terminal mode and takes you out of NEWUSER mode. Now power cycle the TNC and ensure you get the Kantronics signon page and the CMD: prompt.

Now start up the APRS program, I assume WinAPRS from your decription of the limited feedback. Now you need to go to settings and set the TNC Type, Com port, com port speed (9600). You must also set the Station's callsign in the Station Settings page, along with the lat and lon of the station, icon and any position comment you would like. Then initiate a Open VHF TNC. Yous hould now see the the commands being sent to the TNC. Pay attention, you'll see the last command of ?APRS? This is a query being sent. When this is sent, you should see the TNC's TX LED light and the radio should also TX. Then wait for some RX'ed packets. See if the stations are being mapped. You can monitor the packets comming in, in the bottom window.

Thats a start...let us know how it goes.

According to my APRS maps, there are thousands of hams around the world who are active with APRS. But with an average of 2 posts per day, this groups is obviously not where hams are getting information about APRS. So can someone point me to a more active and informative web page for discussions about APRS?

For discussions about the use of G4IDE's UI-View software, the UI-View
yahoo group is a good place. However, we who are moderating the ui-view
group have been trying to encourage ui-view-group members to go to the
APRS group for general APRS discussions, rather than discussing those
matters in the software-specific group.
(web page? it's an email list!)

In my experience, it takes months and months to become accepted as a
member of the TAPR APRSSIG list. (I have registered to join long time
ago, and have received a "thank you for registering, we'll look into it,
you'll be informed" message (quoted from memory).

2429. Re: [APRS] Need suggestions

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-16 23:05:51 UTC
From: Edmund F Leavitt
Topic: 2420 Message: 2429

Yup. I am doing what you describe. And I see the commands sent to the TNC, and I see the TNC transmit. One thing that is slightly odd is that some one of the commands gets displayed as little box characters rather than letters/numbers. I guessed that might just that the font didn't have anything for some control character? And the last command that stays on the screen is the ?APRS? that you mentioned.

That's where things go no further. I see receptions on the radio and TNC, but they never appear to make it to the PC and the APRS software. If I open the terminal window, nothing appears.

Then, if I turn off the radio, take APRS down, start a terminal emulator program the KPC3+ happily dumps all the traffic it has seen recently to the screen. It is apparently getting held in the TNC's buffer awaiting something from the PC (like CTS ??) . That's why I suspect some sort of flow control problem.

2434. Using MFJ-1276 for an I-gate?

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-18 12:20:28 UTC
From: Bret Chilcott
Topic: 2434 Message: 2434

Fellow hams, I have just purchased an MFJ-1276 TNC from an estate of a SK. I want to use it to run an I-Gate through a PC running Windows 2000 and UI-View.

Where can I find information on how to set it up for this purpose? There are more than a dozen or so jumpers that I don't have a clue where they should be set.

A VERY basic question is, the small micro switches on the back, is the up position on or off? I do have a manual, but it leaves overlooks the obvious.

If you or if you know of someone using an MFJ-1276 as I descibed above, I would like to communicate with them in hopes of getting my I-gate station going.

Thank you.

Bret C

2435. Using MFJ-1276 for an I-gate?

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-18 11:51:42 UTC
From: Bret Chilcott
Topic: 2434 Message: 2435

Fellow Hams:
I just purchased a MFJ-1276 in hopes of using it to run an I-gate.
Can somebody direct me to information that will tell me, will a 1276
work and what should the settings be set to? Also, FYI I am using it
with a PC operating Windows 2000 and UI-view32.
I am confused by the dozon or more jumpers in the TNC. Since I
purchased it used, I am not sure where they should be set.

Thank you for your assitance!

When I was trying PocketAPRS on my Palm a couple of years ago, it was
behaving like that. I took it that it was because I hadn't registered.
Maybe that's you reason as well?

I don't know; I haven't thought any more about it after my previous PDA
crashed. If the software isn't supported any more, maybe nobody will
issue registration keys.

The Deluo Lite only has a female PS2-type DIN connector. I can send you the pin-out if you want. When I bought it from Deluo, I got a free adapter that splits the single PS2 connector into a DB-9 serial connector and a male PS2 connector. You plug the male PS2 into your laptop's keyboard or mouse port to power the GPS and the DB-9 serial connector has the GPS send, receive, and GND wires. Since I'm using mine with a TinyTrak, I just cut the PS2 connector off the GPS and used the bare wires to solder to another connector that has the power, gnd, and GPS TX and RX in one 4-pin connector.

As for the NMEA sentences, all you have to do is apply power to the GPS and it'll start sending all of the sentences every second. Older Deluo GPS modules has software that you could use to program the GPS to only send certain sentences and a whatever rate you wanted, but I can't find any software to work with the new Lite model.

Topic: 2437 Message: 2444

I gave up on Mike when the site went down and got a Ipaq 2215 off eBay instead. At least the CE version is still running to get reg codes from. You have to hand it to Mike as he did try and there many different models of palm that if one is doing this for a living that it might work. Mike already has a full time job that pays the bills and this was a hobby for him.

From the web site:

My sincere thanks to the APRS and Amateur Radio communities for the great support during our time together. Those with pending registration requests will be responded to shortly regarding options.

Might give it a try to see if he still can be reached via mail and will give a universal registration code for the unit.

Yes, I figured it had something to do with the fact that I haven't registered. But since it's apparently defunct now, I figure I can't register it anyway, right?

From: Ace Richards
Topic: 2446 Message: 2446

Hello, I have a few VHF HT's made by a company called :QUANZHOU NANFENG ELECTRONICS CO., LTD. the model is a Nanfeng NF-218, they are 137-167 Mhz 3watts, 10 channel. The company calls them a " VHF HAND HELD WIRELESS INTERPHONE"I got them in a auction. They all talk to reach other on all the channels. but I need a schematic, any help would be GREATLY appreciated. I have been on the companies pseudo web site and requested the information a few times, but either my Chinese is rusty, ot i cant speak their form of english....

2447. HF APRS?

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-21 16:26:50 UTC
From: n0iu
Topic: 2447 Message: 2447

I know this question or one like it must have been asked a few thousand times before, so I apologize in advance.

I decided to blow the dust off my Kam Plus and try this APRS thing. I have a registered copy of UI-View32 v1.97. The VHF side works as expected.

Recently a friend suggested I try HF APRS on 30 meters. He gave me the frequency of 10.147.60 MHz USB. Works great! I can receive hits from all over the country and Canada so something must be working right. The rig I am using is an Icom 756 Pro and I am feeding the Kam into the rig through the ACC1 port on the back. Normally, I use the Kam for FSK RTTY which means I switch the rig from SSB to the RTTY mode. The only way I can get the Kam to transmit APRS packets is when I switch the radio to RTTY mode, but then I obviously have to tune a bit higher to about 10.148.90 MHz.

Is this where I should be transmitting or how do I adjust for the difference between SSB and RTTY?

NØIU

The article on the FCC Fine is in this months QST.
Funny this post shows up, and I just finished reading it.

I would think, a Licensed Amateur Operator should be able to use them as long as they use them inside the Amateur Spectrum?
10 Channels though? May be difficult to get a repeater offset, but using simplex for APRS may work pretty good if you can get that frequency.

My memory serves that FCC Type Acceptance is for items that are sold in the US.
If you have the ability to build (Home brew) or obtain products outside of the US and they are used within the limits of once license,
I am pretty sure they can be used.

This pretty says it all...

http://www.pocketaprs.com/

I have been a PocketAPRS user since the beginning days of the old gray scale Palm II's and III's. I loved the program, I still do for the most part. It really eveolved over time and I enjoyed using it with my full color palms. The maps were decent once Mike came up with his own vectoring scheme. But as stated, with the ever fast changing of the Palm OS and the devices, it became "just too damn hard" to keep up.

I know Mike ran into issues with compatibility of certain devices as well, such as TNC's and GPS's. even when he tried to get samples to develop with, some were not that eager. Manufactuers can rally hurt their own market, I'm a true beleiver of that.

I'll miss talking to Mike at Dayton and DCC, but everything must go on I guess. Maybe one day I'll try out the PocketPC version, but i just like Palm too much to switch yet. The current PocketAPRS still works fine. I'm not sure if Mike will continue to actually provide that last version for download and use. It will, of course be without support.

Are Kenwood TK-349s legal? If so they are not type accepted for US commercial use but I'm told they are fine for Amateur use because they meet specs for Amateur use. I have seen lots of these "grey market" radios sold on eBay and Overstock.com.

As a Motorola buff, I have seen many times where this situation arises. A ham radio must be FCC certified if it is to be sold in mass to the amateur population in the US. Also a commercial radio must be FCC certified for use on commercial (basically anything else but ham) frequencies, whether it was sold in the US or not. Likely that restaurant owner was using those radios on a commercial freq, and those handhelds are not FCC certified for use on commercial bands.

For example, Motorola makes several different models of the same type of radio, one that is FCC certified and one that is not. The HT1250, for example, is an FCC certified commercial radio. The Pro7150 is the *exact* same radio but is not FCC certified. However, it is legal to use both radios on the ham bands.

Rusty

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-21 23:13:33 UTC
From: Bob Bailey
Topic: 2446 Message: 2458

Any transmitter marketed in the United States must be type accepted for the Radio Service it is intended for. The fact that amatuers may use any transciever in thier respective service for that particular radio would have to meet this requirement to enter the U.S. market. If it does not meet this criteria it is deemed illegal by the Federal Communications Commission by that simple fact. You may not travel to China and buy this radio with the intention of using it in the Amatuer Service you will be stopped by customs (or should be) and it confiscated.

I am not critizing anyone here just pointing out that one could get in trouble just by possessing it as remote as this might seem but I would think any Amateur Radio operator would want to promote respect for all radio law at all avenues wouldn't you? Hams get mighty upset when their bands are encroached by truck drivers with radios that have been modified outside of their legal technical boundries don't we and demand enforcement.

Coming from a country where "anything goes" as far as radios for amateur use are concerned (the UK), how does the FCC's type acceptance square with home built equipment?

Any transmitter marketed in the United States must be type accepted for the Radio Service it is intended for. The fact that amatuers may use any transciever in thier respective service for that particular radio would have to meet this requirement to enter the U.S. market. If it does not meet this criteria it is deemed illegal by the Federal Communications Commission by that simple fact. You may not travel to China and buy this radio with the intention of using it in the Amatuer Service you will be stopped by customs (or should be) and it confiscated.

2460. RE: [APRS] Re: Off The Wall Question

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-21 23:39:57 UTC
From: Bob Bailey
Topic: 2446 Message: 2460

Home built radios intended for the amateur service are obviously exempt of this requirement. This only applies to radios that are intended "for sale" and yes you may sell to another ham your home built radio for amatuer service but it is the user of the radio that is responsible for its operation. You may not build a radio capable of operating in, say public service and sell them to State Police agencies unless it meets the "type acceptance criteria". If you build a radio and submit an application to the FCC for type acceptance if they give you one you are good to go. If not pay up in fines.

From: Robert R.
Topic: 2461 Message: 2461

Does anyone else have the same problem I am finding with the Digitraveler:

After it gets a fix, the elevation and position just seem to jump around.

Example:
Altitude will swing as much as 500 Ft, position will jump erratically
between random points hundreds of feet apart.
This happens approx 2 to 3 times a SECOND.
Using VisualGPS the rate of climb jumps from positive to negative.
Using the correct cable with pins 2,3 and 5 and
with the two jumpers in place on the DB9.
It's the digitraveler. If I put one of my other GPS units on the same com
port,
it settles down to "normal".

Anybody have a similar experience?
Any ideas?

Thanks

Found this at another site apparenty Amateur Radio does not require type acceptance
---
The FCC has proposed fining Pilot Travel Centers LLC $125,000 for allegedly marketing unauthorized RF devices--specifically, transceivers labeled as Amateur Radio Service (ARS) equipment but intended for use on both Citizens Band and amateur frequencies. CB transmitters must receive FCC certification--formerly called

"type acceptance." Amateur Radio equipment does not require FCC certification.

From: Ace Richards
Topic: 2464 Message: 2464

Yes Keith LaBorde - K4KAL [mailto:k4kal@...], ir=t is funnt that I ask about a schematic for these radios right after a chinese Restaurant owner goes out of business when the FCC is going to fine him. but these radios have nothing to do with that, so the remark is moot.
I have been a 'Ham' for over 30 years, a First Class Radio Telephone license holder for over 30 years, and an ex-Motorola design engineer. I am well awarw of all the type certification rules and regulations, and all anyone has to do is visit the FCC web site, por look up in thhe CFR (Code of Federal Regulations) to get the straight story, all the conjecture on here is goofy.
I feel as if I am defending myself here...All I ask was if someone had schmatics for these radios. I never mentioned a purpose for these radios of if they were going to in fact be used in the United States, which they are not. I work for FEMA, as a Search & Rescue Tech., and Travel Internationally to respond to major Disasters.
Funny I ask a simple question about a schematic for a radio, or information about the company, and it was immediately assumed i was going to use them in this country, and then a debate over what type acceptance and / or certification means to the various frequenct bands, and then i was associated with this fellow in new York.
Rest assured, the next time i ask this group a question, i will do a 10 page dissertation on the reasons I need the schematic.

As a P.S. the auction I bought these radios at was held in a small town in Indonesia, as a fund raiser, to raise money fo a Disaster they experienced in december 2004.

And no, customs would not and has no reason to confiscate these radios. upon entering the USA.

Dont feel bad. I made a post one time and it turned
into an argument about registration which wasnt the
origional post that I made.
Its no wonder that amateur radio will be a thing of
the past in the not-so distant future. Lack of adult
thinking and just plain stupidity.

Ace,

Don't worry about the self proclaimed experts that haunt these (and
other) online forums. Anonymity is like gasoline to a raging fire
when spouting one's ignorance on any given subject.

If you really want to see the worst of this sort of behavior, just
visit any forum on EHAM.NET. I use to monitor some of those forums
and finally gave up trying to 'filter' through the BS and crap that
ALWAYS overwhelmed the topic at hand. With the US lagging most of the
world in many fields of education, we sure seem to have an
overabundance of 'self-proclaimed experts'.

Good Luck on your schematic search. It can be a nightmare trying to
find service info on gear these day with everything being designed
as 'throw-away'.

If you want to be treated like Einstein we need some way to know you
are an Einstein in advance. People join these groups to get
information and to share information. I am sorry that you feel you
were insulted by my offering as much as I did. I assumed you knew
little about the radios you were searching information for. With as
much experience as you obviously have I am surprised you would resort
to such a mundane source as this appears to be to you and others.
Bob KAØMR
P.S. I too have a GROL and work in a Motorola shop and have an Extra
Class license etc. ut I ask question here too and get plenty of info.

<<Why would they be illegal to use in the ham band if the operator holds a valid Amateur Radio license?>>

Type acceptance governs commercial SALES--not ham USE. Type acceptance is there to ensure that non-technical users will be using radios that meet technical requirements for their emissions. Ham users take a technical test that in theory certifies us as being able to build, test, and maintain ham radios and the responsibility is on US to make sure the radios meet emission requirements before they are used.

If those Chinese wonders work perfectly well [sic] they may still have emissions that occupy too wide a bandwidth, or violate emission requirements in other ways. So they may be illegal for ham use--unless the ham is willing to test each one of them and make sure it complies. Or, pay heavily for each one that is built to the usual exacting Chinese quality standards.

But of course, a licensed ham is supposed to have read and studied all this stuff.<G>

IIRC the Chinese restaurant that was using similar radios illegally for several months has now closed, trying to avoid the huge FCC fines. And they were in NJ, not NY.

(Not quite ARES/RACES)
Held a Red Cross Disaster Assessment/Communications drill this last weekend. I put APRS on their
Disaster Assessment vehicles dispatched. Red Cross were blown away with the ability to track
their vehicles.
One was a D7a. The other was a Kamplus with a HTX-202. Third vehicle didn't make the cut.

From: Dakota Summerhawk
Topic: 2472 Message: 2474

Does anyone know where the logs for station and tracking information is kept on the CE version of APRS? Looking for information to track speed and the like from my GPS as it does not have a display.
Thanks
Dakota

2475. statewide comms help question

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-23 15:51:18 UTC
From: WILLIAM
Topic: 2475 Message: 2475

I hope that I can get some constructive help on this question.
If a fire department wanted to use aprs to track vehicles and they used a commercial radio on a commercial frequency, would that be acceptable or would they be violating some law.
I ask this becuse Im going to introduce some pretty crazy but workable ideas to the state I live in for state wide emergency communications.
Seems like these guys who lack some commen sense want to spend millions of dollars making a system work that has failed before and does not want to acknowledge amateur radio as being worth anything to them which in my mind is a piss-poor attitude.
I wish you guys could see their interoperability study. I got more laughs out of it the a night with jeff foxworthy.
Anyway, let me know if its a legal thing to do if they use their own commercial equipment and a commercial frequency.
Thanks
William

Hi Al, Kerry - WA2NAN here in St. Lawrence County N.Y. I am the EC and Radio Officer here and we just got APRS up here a couple months back. We have experimented with it in ambulances and sheriff cars etc. and the county and red cross are very impressed with it. We plan to work it into our drills and real time activations whenever possible. We are also setting up wx stations around the county so ARES/RACES can have real-time local weather.....73...Kerry

<<If a fire department wanted to use aprs to track vehicles and they used a commercial radio on a commercial frequency, would that be acceptable or would they be violating some law.>>

WIlliam, that is going to depend on what is allowed for the frequencies they are using. You'll need to find out what they are using, or what they can use, and then see what modes are allowed for it.

2478. RE: [APRS] statewide comms help question

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-24 19:07:54 UTC
From: John Everman
Topic: 2475 Message: 2478

WILLIAM [WA1EMT@...] pondered:

>If a fire department wanted to use aprs to track vehicles and they
>used a commercial radio on a commercial frequency, would that be
>acceptable or would they be violating some law.

First, IANAL. With that out of the way, fire departments are governed by Part 90 of Title 47. Here's a link:

http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/octqtr/47cfr90.207.htm

(Now that's a link!) The section here speaks of emission types and allowed uses of those emission types. This is rule 90.207.

Your average fire department gets licensed for emission type F3E. As we all remember from tests long long ago, F3E is FM (F) Analog (3) Voice (E). Skip down in Rule 90.207 to section (k), which seems to say that radiolocation transmissions are allowed. Section (b) allows automatic station ID.

All this stuff should be run past the corporation counsel of the entity, of course. If your FD has an old unused frequency (VHF-lo, for instance), you might have the radios and license already in place. The cost of the GPS, tracker unit, and installation needs to be calculated-- I'm sure you need approval from a couple levels of bureaucracy. (It would be worth making sure that whoever is contracted for service to your FD's radios is OK with the install. No sense getting jammed up if you don't have to.)

FWIW, For years I've been a proponent of a license-free national public frequency for general public AVL/APRS use. I picture the market to be huge-- VFDs, parents of teens, pizza guys, couriers, delivery vehicles, smaller trucking companies, boaters, hunters, school buses, etc. Just run down to the local EverythingMart, and buy it like a CB. Base stations would only monitor, and feed the works to the internet. Advertising should make the servers profitable, to boot.

73 de John, n9mdh

PS: Here's the big question... What about mounting a ham station on the FD vehicles? As long as you don't have a commercial interest and make it so that no one else can control the transmission, it would simply be a remote transmitter, no?

That is incorrect. Under Part 97.221(a) (b) (c) (d)
A message forwarding system may operate under automatic rules just as a repeater located in a remote mountaintop as long as the station responds to interrogation by another station under either local control or remote control i.e. automatic and the bandwidth of the transmitting station is no wider than 500 Hz.
Packet and APRS both qualify under these rules. This means if you want to put an APRS station in your car and your wife or child are operating it the control operator does not have to be present.

From: Bob Bailey
Topic: 2479 Message: 2483

That is I quoted Part 97.221 Paragraphs (a) through (d) address this issue.

Study it carefully.

Paragraph (a) and (b) clarifies what is not covered under this rule and exactly what band you may operate under these conditions.

Paragraph (c) clarifies that RTTY emmision is included as digital mode under this rule, that the radio answers automatically without human intervention ONLY by another station that is in fact operating either under direct human control,by remote control or qualified automatic control.

And finally (d) clarifes that the station and the calling station emissions occupy no more than 500 Hz bandwidth and that means someone cannot use the microphone for voice as it would occupy 3 KHz or more bandwidth. Under this rule an APRS station may operate unattended anywhere at anytime without local control as long as the radio is never used for phone purpose at anytime unless the operator is qualified to operate the station or qualifies under third party rule which essentially means a licensed ham present in control anytime the radio is take out of automatic digital mode.

So... What if the transmitter stays keyed for some unknown reason.
The wife and kids run around town with a rig that is stuck in transmit until they get home for the Licensed Amateur to resolve.
And that's ok?

What I find interesting, and this may be a change of subject if people who are offering up the APRS Transmitters for like "Fun Runs".
They setup the ID's to be instead of ones callsigns.. they configure "Mile1", "Mile2" etc.. marking the path of a race.
Then have vehicles that are driven by someone unlicensed with.. "LeadRunner", etc..
This is all done with Volunteerism in mind, and noone is making any money because this is Amateurs volunteering services,
But I think it certainly goes over into an Gray area..

I play it safe..

I run a WX Station over the Internet which is on all the time.
It has my call defined in it, but I am not transmitting anything.

I have two mobile units that can send APRS positioning information.
The one that is on, is only the one I am next to at the time...
Hence.. being in control.

Thanks for your explanation.
But, at the risk of loosing a license, I would not dare have a transmitted anywhere with my call sign unless I can lean over and turn it on/off.

2485. Re: remote stations?

Yahoo group: APRS (1998 — 2006)
Date: 2005-03-25 02:18:47 UTC
From: Bob Bailey
Topic: 2479 Message: 2485

The radio could be turned off by the wife or kids since it is "automatic" mode and the could turn it on. This rule was made to promote digital APRS etc and the rules were relaxed. Echolink created the same delima as many station were putting remote trancievers on 2m and they qualified as "auxillary" stations which must be done at 222 MHz or above but as an ARRL Official Observer were asked by Riley Hollingworth to not cite offenders as they wanted to promote the new technolgy which I was dead set against in the beginning as I expected renegade Echolink stations all over the 2m band wreaking havoc for existing rpeater owners but I was proven wrong and now am a promoter of Echolink just goes to show what do I know.

Operating APRS in races described by you herein are encouraged as well and personally I find no problem really exist for the most part and promote APRS as much as I can it is a pretty useful mode. Has many facets that can be used by many different areas of ham i.e. stormspotting, ARES-RACES etc.

But don't worry too much about an occasional error in operating. As an OO for many years when I encounter something that is of an interest to an OO the first thing I trybassess is what is the real intent of the station appearing to be in violation and most of the time it is an accident and I make not issue of it.

I have been GPS busy this week...

I recently took my Deluo GPS and installed it permanantly in my truck for use with APRS (HamHUD II or OpenTracker). I also bought a new Garmin Map176 Color. I bent a simple angle bracket and mounted the GPS right above my CD player. I took some new pictures and posted on my site at http://www.ke4nyv.com/gpsstuff.htm

Thought I would share these for those interested.

Subject: [APRS] New GPS Installs

I have been GPS busy this week...

I recently took my Deluo GPS and installed it permanantly in my truck for use with APRS (HamHUD II or OpenTracker). I also bought a new Garmin Map176 Color. I bent a simple angle bracket and mounted the GPS right above my CD player. I took some new pictures and posted on my site at http://www.ke4nyv.com/gpsstuff.htm

Thought I would share these for those interested.

2491. APRS+SA & Win2000 Prof

Yahoo group: APRS (1998 — 2006)
Date: 2005-04-04 02:13:54 UTC
From: Harry KC5TRB
Topic: 2491 Message: 2491

I got a new laptop with W2000P. I loaded
APRS+SA 2.24 (WinNT) on it and I am
using a KPC-3. It seems that APRS+SA is
NOT displaying some stations on the
Position or History pages, one of them is
my TTIII in my van. The TNC window shows
the packets from the undisplayed stations
to be good packets.

Any body have the same problem and a workaround?

Thanks
Harry

2492. AX.25 Protocol - Commercial Use?

Yahoo group: APRS (1998 — 2006)
Date: 2005-04-06 01:24:13 UTC
From: Michael Haynie
Topic: 2492 Message: 2492

I see lots of the TNC manufacturers are using AX.25 in their commercial products. Anyone know how this is legal? I know that APRS is amateur only, but I assume that AX.25, even though developed by amateurs, can still be used in commercial systems. Anyone have details on this?

Thanks in advance,
Michael

TAPR has everything you'd want to know about AX.25:

http://www.tapr.org/tapr/html/Fax25.html

Essentially, AX.25 is the Amateur Radio implementation of the X.25 protocol used in packet switching networks. Here's Cisco's take on X.25:

http://www.cisco.com/univercd/cc/td/doc/cisintwk/ito_doc/x25.htm

Here's the Wikipedia entry:

http://en.wikipedia.org/wiki/X.25

BTW, here's the wikipedia article on AX.25:

http://en.wikipedia.org/wiki/AX.25

From my perspective, the more stuff that uses the AX.25 protocol, the better-- it increases the odds of finding industrial/consumer stuff that might be modified for ham use.

2495. Group Codes for weather stations

Yahoo group: APRS (1998 — 2006)
Date: 2005-04-07 01:52:01 UTC
From: Wayne T. Miles
Topic: 2495 Message: 2495

Hello,

I have a Kenwood D-700 and have a question concerning "Group Codes"

I would like to set up my radio so that I can disable receiving weather reports.

Q: Do weather stations use a group code? Do they use a code such as "skywarn" or some other group ID?

Is it possible to set up the radio so that I do not have to see the weather packets all the time? If so, hiw is this done?

Thanks!

Wayne

2496. UIDIGI settings

Kerry,WA2NAN here. I'd like to know what the best setting for the unproto (uidigi setting) is in a tnc-2 uidigi stand alone digipeater. I have 5 digis in about a 75 mile radius here in the mountains in NY. There is very little traffic on the network, never more than about 20 to 30 stations base, mobile, WX, etc. What would give me the best mobile coverage?.....thanks.....Kerry

From: w3ce_qrp
Topic: 2503 Message: 2503

I was looking to upgrade my KPC3 to the latest ROM version 8.2

A while back a message was posted to look on Ebay for there were some for sale there. By the time I logged into Ebay, they were gone. Kantronics does not offer this firmware any more and I would really like to get it.

Does anybody have a chip to sell? Maybe know where there is a bin or hex file image of the chip to download?

Thanks
AL w3ce

2507. RE: [APRS] Kantronics KPC3 Rom version 8.2

Yahoo group: APRS (1998 — 2006)
Date: 2005-04-14 14:23:01 UTC
From: Jim Andrews
Topic: 2503 Message: 2507

Latest for the KPC-3 was v8.2

KPC-3+ is now v9. IIRC the 3+ started off with v8 and tracked the non-plus versions up to 8.2. They then added the soft-UART for a GPS to the plus (v8.3), which the 3 can't do.

The 3 and 3+ are very different units (different processor and board design) so it must be the right version for your unit.

Kantronics policy on old versions is very poor, I've never understood why they can't still have the latest version available for each unit they have made. Would cost them nothing in stock terms as the EPROM would be programmed to order.

No.

Kantronics have a policy of not supporting old models, so you cannot get
anything for the non-plus model.

Crazy, but there you go!

ARRRGH!!!

Thanks anyway. BTW ☐ if anyone can clone a v8.2 ROM, please let me know.
Off-list is fine.

Mark ☐ N9WYS (at) Ameritech (dot) net

No.

Kantronics have a policy of not supporting old models, so you cannot get
anything for the non-plus model.

Crazy, but there you go!

Jim

2514. Small and light APRS kit

Yahoo group: APRS (1998 — 2006)
Date: 2005-04-17 15:16:36 UTC
From: spaced2k3
Topic: 2514 Message: 2514

Hello

I am looking to purchase, or ideally make, a small APRS kit that I can stuff in my backpack when I go rollerblading, biking, etc.

Something like the TinyTrak3 seems like it would fit the bill, but I am wondering what options are out there for GPS receivers and radios.

The area that I would be using this is in the river valley of the city I live in, signal strength and output power is reasonably important.

Anyone have any experience with something like this? Any good GPS and radio suggestions?

Thanks,

2515. KPC3 ROM

Hi,

I would also be interested in the upgrade rom for the KPC-3 (not plus).

I did upgrade my rom a few years ago and I think it is ver 6.0 now but
would like to get the 8.2 version if anyone has it available.

Thanks,

Richard, KR4XN

Although I am a big fan of the TinyTrak, a Kenwood TH-D7 and and Garmin Etrex make a pretty good and compact setup. I use them together all the time when I'm out riding my bike. Just be sure and upgrade the antenna on the D7 and don't forget to set the key lock before you stuff it in your backpack.

From: glw12345
Topic: 2520 Message: 2520

All:

I have found on ebay a cheap GPS board. The board is using the SiRF chipset. The seller seems to have a good supply of them. They are $20.00 ea.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4661&item=7508881725&rd=1&ssPageName=WDVW

The board is NMEA ready. All you need is a active gps antenna,5V supply,txa and rxa and your in business. I used a LM7805 for the 5V supply(both for vcc and antenna) and hooked up the wires tx, rx and gnd to a db9. Both myself and a friend purchased one and using this with a Kenwood tmd-700a. Works great.

Regards

Gray

You will need a TNC connected to the radio, and set MYALIAS to WIDE (or RELAY) and DIGIPEAT to YES. (plus some other settings in order to not get connected and not risk that the memory gets full).

I don't know how it was originally, but I think that the author, Roger
G4IDE (now SK), once told users that such double installations for the
same user were OK.
With today's licensing and "donationware" policy, it should be quite OK.
You're always welcome to donate another amount to belgian cancer
research, though!

I am happy with my Garmin GPS 18PC

http://www.garmin.com/products/gps18oem/

I just have it sitting on the dash. The cigarette lighter plug
contains the 5 vdc regulator, so if you remove it you'll have to
provide your own regulated supply. There is a serial version
with just the wire leads and a USB version that is only useful
with Garmin software.

As much as I'd love to buy a TH-D7, I'm pretty certain I would find myself sleeping on the couch for a good week if I came home with a toy with that kind of price tag.

I am finding that the Garmin Etrek is quite affordable - just need a cheap(er) radio to hook it up to.

I would assume that the requirements for a radio for APRS needs are pretty basic - The unit would need the ability to hook up to an external PTT, mic and speaker.. otherwise a basic VHF rig?

Thanks,

Most basic 2M HTs should work as the radio part of the system, but you still need something to take the GPS data and turn it into something that can be transmitted by the radio.

A Tiny Trak is one option.

http://www.byonics.com/tinytrak/

It will interface your GPS to your HT so you can transmit a position report.

This micro TNC also looks interesting.

http://www.elcom.gr/

It appears to be able to do what the Tiny Trak does, but it is also a full 1200 baud TNC that you could connect to a computer for other packet use.

I haven't tried either. I use a Paccomm HandiPacket TNC in the mobile with a laptop and HTX-202 HT. The HandiPacket can be used without the laptop as a tracker, but I've never used it that way.

I assume from your statement about the TH-D7 that a
Byonics pocket tracker does not have enough RF.

If so, all you need is an old Icom IC2AT for the RF, a
Tinytrack for the beaconing and your existing Etrek GPS.
See http://www.byonics.com/tinytrak

There are several ways to mount a Tinytrack to a
HT - from a clamshell metal eyeglass case rubber
banded to the radio to more elaborate ideas.

Here's my backpack tracker tentative plan - it's not
been executed yet as not all of the parts have been
acquired...

Take a 2AT (not an 02AT) which I've seen for under
$20 at the local hamfest.... just test it out before
you buy it. At the same hamfest find a dead BP-7
or BP-8 battery pack. When you get home, gut the
battery pack of the dead cells, and make a diagram
of all of the connections.

Now fit a Tinytrack board into the battery case. Leave
the radio connector DB9 off of the board along with the
power LED. Cut a hole in the battery case bottom (the
end that fist into the charger) for the GPS / computer
DB-9 connector and position it so that the GPS can plug
into it or a cable to the computer serial port can plug
into it.

The other two LEDs are replaced by 2ma units to lower the
power drain, and relocated to the back side of the Tinytrack
board and stuck through holes in the battery pack case.
A slide switch hole is cut next to the GPS DB9 a recessed

switch mounted, then wired for DC power to the 2AT being always-on or switched by the Tinytrack (I intend the unit to be used for backpacking or dog tracking but may occasionally be used as a regular 2m HT). A custom cable from a pair of 1/8" jacks on the back of the battery pack will connect the Tinytrack to the external speaker and mic jacks providing TX audio, RX audio and PTT.

The BP8 case will still have some space left (I've spent an evening test fitting stuff) and the leftover space in the BP8 will still hold 9v if AAs are used (tight fit) or AAA sized cells (easy fit). No, it won't run for 3 days the way a fully charged normal BP8 would, but it's enough for a decent day hike.... and it can be charged from any 12v source (i.e. a car cigarette lighter).

2536. Digipeater question

Yahoo group: APRS (1998 — 2006)
Date: 2005-04-28 21:51:14 UTC
From: Roger Hammond
Topic: 2536 Message: 2536

APRS is starting to grow a little in our town and we finally got someone interested that had an antenna at 60', so that we could use his station as both an IGATE and a DIGI, this is the WY0F station in the included data. We're both running UI-View32 and I helped him setup his station. It seems like, even though WY0F is setup as an IGATE and a DIGI, the majority of the traffic gets DIGI'd and then passed to the Internet through my (KC0MWM) station. Is this normal? Here's the data I just copied from my IGATE traffic window:

From: J. Rausch
Topic: 2536 Message: 2537

I beleive in a multi-iGate situation its a matter of whoever hears it first, gates it first. That can also mean that both stations could hear it and both gate it in. There is no dupe checking because there would have to be some kind of checking between the 2 or more igates at all time. If you want his station to be the primary iGate, I suggest turning off the iGate function at your station.

Back when iGates were rare, it was common practice to basically "feed in" all of the data we wanted because the incomming data stream to APRS-IS servers was not that great. Now with the popularity and easibility of setting up an iGate, multi iGates are really not needed in a area where one can hear the local traffic no problem. There is no reason to clog up bandwidth with excessive duplicate packets.

Hope that helps and if I am wrong someone will chime in and correct it.

2538. Serial Cable Interference

Yahoo group: APRS (1998 — 2006)
Date: 2005-04-29 13:25:34 UTC
From: wb8imy
Topic: 2538 Message: 2538

I am attempting to use a Garmin eTrex GPS in an APRS setup with an older ICOM IC-2000H transceiver. I've run into a problem with an interfering signal generated by the eTrex.

The signal is being radiated from the GPS serial cable and is making its way into the transmit audio line from the TNC to the radio, causing distorted, undecodable packets. Even with the serial cable completely disconnected from the radio and TNC (but with the cable nearby), the interference can still be heard weakly in the IC-2000H transmit audio. I assume that something in the IC-2000H microphone amplifier stages is uniquely sensitive to the signal and is detecting/rectifying it.

Has anyone encountered a problem like this and has managed to cure it? The eTrex cable has a built-in ferrite choke and I have applied a second choke, but to no avail.

Steve

Steve, any chance you need a blocking capacitor on that line to keep out DC from a loop?

Well, I'd be concerned that the capacitor would also block the data
signal, but it might be worth a try.

Try a ferrite core or bead at the point where the cable attaches to
the Etrex. May help but no guarentee.

2543. KPC3 Tracker

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-04 13:37:31 UTC
From: stancol
Topic: 2543 Message: 2543

I've finally gotten my KPC3 (not +) setup as a Tracker [N0YXV-9]. Only thing I haven't been able to find is good information on proper settings inside the KPC3. Most of the information I've been finding is some what contradicting, so I'm having to read between the lines.

Although my icon is getting reported correctly for programs like UI-View my mobile is coming up as a house on findu.com. Is there someway to add a comment line to the end of my GPS string to make sure the icons come out correctly?

Any thoughts on how to clear the GPS buffers after each use? Currently if the GPS becomes disconnected from the TNC the TNC will continue to broadcast my last known position as current. I tried adding CLEAR to the end of my BLT statement but only seams to work on the + model.

What about running a mobile PBBS? Good idea - bad idea? If it's good (or even just ok) any thoughts on how to set it up? My thinking was it might be nice to read messages to me on the PBBS after a trip. That way you could keep both hands on the wheel but still be able to get messages. The KPC3 manual describes a way to transfer all your incoming messages directly to the PBBS but so far it doesn't work when I connect.

Hi All,
I am new to APRS and I have some basic questions. I did know that TinyTrack3 only work as one-way tracker (transmitter). Are there any special devices (interfaces/adapters/TNc/cable/software) working as a 2-way trackers like Garmin Rino does ? I mean this adapter/Tnc/device/software can load up APRS stations/other trackers positions automatically as waypoints into my Garmin Geko 301.
Thank You

You don't need to login to recieve data, only to inject data into the APRS-IS.

Greetings....

I have access to an "ole" hams "node in a box" that he made some time back....

The radio and all is fine, the question I have is how easy is it to update/upgrade the chips? He does not have any of the EPROM burners...

The TNC is a Pac-Comm Tiny-2
He says it has NetRom on it right now...
I am very new to APRS/Packet in general, so any help will be appreciated...

How much would this "node in a box" be worth? He said make an offer, which I hate doing.....

Also, How much is an MFJ-1278 worth these days? I don't pay too close attention to eBay, as some folks are just nuts, paying the same price as a new rig with warrantee on old rigs.....

Thanks for your help!

Below is the .CMD file I am using to set my KPC-3Plus in UI-View mobile PC
and you will find some of your answer in looking at it.
some settings remain in the TNC parameters as they are used anyway when the PC is not used in the Car.
note that my beacon rate is set to 10 and 25 minutes as the BLT is use to control the beaconing when the PC is not use, and when the PC is used, UI-View parameter are the one that take over that control.

If you are not using a PC, you can adapt those settings for proper operation.
some command dont need to be duplicated as I did, as the settings remain when set.

good luck & 73

Topic: 2552 Message: 2553

Maybe the problem is your cable? If you are using a "NULL Modem" cable, which is usually used between 2 computer since it swaps pins 2 and 3 so the 2 computers can talk to each other. You should be using a regular modem cable to connect a device to the computer. I keep trying to catch one of the messages about this and delete it before I have a chance to reply then forget to go to my delete folder.

2554. Re: APRS server with out login

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-08 23:48:05 UTC
From: w5evh
Topic: 2544 Message: 2554

I know. I am looking for a server that I can send APRS data to give my status of my IRLP node. When people are in town, I would like them to know about my node. I know that there is a script that will let me connect a TNC and Radio to the node. Well, that to me does not seem as logical in my setup because the node had Internet access. No need to spend money on a TNC and Radio when the iGate is sitting about a foot away from the iGate. I also run the iGate here too. I have a script that alows me to send the information, but does not have any authentication method. Thats why I was looking for a server that does not require a login.

:)

2557. Help understanding n-N paradigm

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-12 14:35:56 UTC
From: Robert (wp4yj)
Topic: 2557 Message: 2557

Sorry if this has been discussed before, I am having a tuff time understanding the n-N paradigm. I thought it was a type of subtract method so that the same APRS sentence from a station would not clog the network (repeat itself on the same digi or go farther than x amount of digi's), but after reading Bob WB4APR
explanation and his note of not using Wide1-1, it makes me
believe that with Wide 1-1 the sentence can go around a few times.

Thanks
Bob WP4YJ/8

2558. PicoPacket Radio Connection Pin Out

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-12 00:04:20 UTC
From: n5na
Topic: 2558 Message: 2558

Hello,

I am trying to get our NWS office's PicoPacket running on APRS. I have it talking to the computer but I am having a problem with the radio connection.

I don't have a manual so would appreciate it if someone could give me the pin out for the RJ-45 radio connection on the front of the TNC.

Thanks,

Alan N5NA

2559. Question about DIGI's and IGate packets

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-12 13:46:56 UTC
From: goldwings98se
Topic: 2559 Message: 2559

I have a couple questions for those that understand how DIGI's and IGates
work.

I have a software program I wrote that decodes APRS packets and plots the
beacons to a map. The packets can come from multiple sources such as FindU,
UIView Logs, TNC's, etc.
So far the program has worked perfectly.
Recently a friend was traveling from Calif. to Texas. My tracking of him was
working perfect until he crossed Tucson, AZ. After that point his packets
were not decoding correctly. More specifically as he crossed Benson, AZ the
longitude decode was not working. Below are 2 packets. The first one
decoded correctly then second one did not. (I removed the callsign for keep
it anonymous)

This is the raw packet
20050504181841,CALLSIGN-10>SR0STS,KD7DR-3*,WIDE2,qAR,KD7MOG-
1:'&\k"zB</]"D:}
Motorcycle Mobile

This is what is decoded to 2005/05/04
18:18:41|32.0571666666667|-110.079833333333|KD7DR-3| 44
deg|73.64|Motorcycle|Motorcycle Mobile

The above worked perfect.

This raw packet
20050504182653,CALLSIGN-10>SR0YSQ,LEMMON,WIDE2*,qAR,KD7MOG-1:'uW$#
R</]"BW}

Decoded as this 2005/05/04
18:26:53|CALLSIGN-10|32.1551666666667|-189.984666666667|LEMMON| 61
deg|73.64|Motorcycle|

As can be seen the packets are 8 minutes apart, same software decoded both
packets, same person sending the packet, no changes to the radio or GPS in
that 8 minutes but yet any packet past Benson, AZ the longitude decodes
incorrect. Is there something I am missing?

2565. "Via Route" changes to be made June 1 2005 in Agassiz-APRS area

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-13 15:41:22 UTC
From: Ron Stordahl
Topic: 2565 Message: 2565

Beginning on June 1, 2005, in the Agassiz-APRSarea, which includes parts of Minnesota, North Dakota and Manitoba) the only acceptable 'Via Route' which will be digi'd by:

MNTRF:N5IN-2 Thief River Falls MN
MNCLR:WB0WTI-10 Clearbrook MN
MNMAH:W0BJI-2 Mahnomen MN
MNBARN:N0CBV-1 Barnsville MN
MNSTC:W0SV-3 Collegeville MN
NDGF:WA0VFY-2 Grand Forks ND
NDMAY:KC0SD-3 Mayville ND
NDVCTY:KC0SD-2 Valley City ND
NDGRFT:KB0ISW-2 Grafton ND:

will be WIDEn-N with a maximum value of N=3.

They will no longer respond to WIDE (without the n-N), TRACE (with or without the n-N) or RELAY after June 1, 2005.

This change is being made nationwide, many areas have already implemented it, as travelers have discovered. The motivation for this is to control excessive path lengths by, in our region, limiting the number of hops to 3 or less. In our region if you can reach a digipeater you will always reach an internet gateway (IGate) with a path of WIDE3-3.

After June 1, 2005 any mobile or station using a path length in excess of 3 hops, received by the above digipeaters, will obtain just a single digipeat and their transmitted position packet will then be dead. I will try to observe prior to that date what route you are sending and e-mail you if changes are needed, but I can't guarantee that I will notice you.

In summary: All stations and mobiles should immediately change their path from it's existing values to simply WIDE3-3. A smaller value is acceptable, such as WIDE2-2 if you wish, but combined routes such as WIDE2-2,WIDE3-3 etc are not acceptable and will result in truncation.

Here are some articles relating to these changes nationwide:

http://web.usna.navy.mil/~bruninga/aprs/fix14439.html

2566. Re: [APRS] "Via Route" changes to be made June 1 2005 in Agassiz-APRS area

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-13 17:05:32 UTC
From: Keith LaBorde - K4KAL
Topic: 2565 Message: 2566

Guys,

I have a Alinco DR-135TP and it is set to the following settings...

Standalone Tracker
I always start with the RESET command.

MYCALL your call with ssid (I use N2YQT-14)
GBAUD 4800
GPSTEXT $GPRMC
LOCATION EVERY x (x=seconds divided by 10, use whatever u want.
the QST article says to use 60 seconds so enter 6.)
UNPROTO APRS VIA <your digi path> (I use RELAY,WIDE)
FLOW OFF
LTMHEAD OFF
LPATH GPSxx VIA < Substitute xx for what you want your
icon to look like, MV is a car, LK is a pickup. see
link below for more. After via put your digi path
I just use RELAY,WIDE>
AUTOLF OFF
LTMON 10
ECHO OFF

So I would enter:
RESET
MYCALL N2YQT-14
GBAUD 4800
GPSTEXT $GPRMC
LOCATION EVERY 6
UNPROTO APRS VIA RELAY,WIDE
FLOW OFF
LTMHEAD OFF
LPATH GPSLK VIA RELAY,WIDE
AUTOLF OFF
LTMON 10
ECHO OFF

Based on this thread below, and the changes that appear to be happening for RELAY,WIDE.

What should I change above, and to what ?

Would it be?

UNPROTO APRS VIA WIDE3-3

LPATH GPSLK VIA WIDE3-3

I want to get this changed before I drive to Dayton next week.

Thanks,

Keith, K4KAL (Atlanta, GA)

This is an attempt to address the congestion on 144.39. See
http://web.usna.navy.mil/~bruninga/aprs/fix14439.html for the reasons why
WIDE1-1 is replacing RELAY.

Hi Alan.

PicoPacket Radio Cable Pin-Out

Pin 1 R-PTT - White
Pin 2 TXA - Black
Pin 3 GND - Red
Pin 4 PTT - Green
Pin 5 RXA - Yellow
Pin 6 N/C - Blue

Cheers,

Dave.

You didn't specify the radio, but here is a link to a diagram
for the Pico Packet to Icom RJ45 mic connector. The cable is
available from buxcomm.com if you want to buy a tnc to radio
cable. There are diagrams for many other TNC cables too.

> Phil
> VA2PHL

Hi Phil

Yes, it is possible. According to the APRS Protocol Referece (from
TAPR site) pg 71,

An APRS message is a text string with a specified addressee. The
addressee is a fixed 9-character field (padded with spaces if
necessary) following the : Data Type Identifier. The addressee field
is followed by another :, then the text of the message.
The message text may be up to 67 characters long, and may contain any
printable ASCII characters except |, ~ or {.

So to send a message to VA2PHL the following packet must be sent:
:VA2PHL :Text of the message

For internet email see also http://www.aprs-is.net/email.htm

2574. Delay?

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-21 19:34:37 UTC
From: stancol
Topic: 2574 Message: 2574

The other day [5/19/05] I logged onto the APRS network after I had been
at work for a couple of hours using UI-View connected to one of the
tier one servers (Think it was the Florida one). After a couple of
minutes I notice the tracker in my car sent out a packet. Since my car
[and the tracker] had been off for over and hour and a half this
concerned me just a little bit. The position of the car hadn't moved so
I relaxed a little bit. Two minutes later I get another packet still
listing my car in the same place. This time I went to the parking lot
to see if my car had been turned on and the car and tracker where both
off. To double check the packet I went to www.findu.com and it listed
the same data I'd seen via UI-View. Later in the day I asked my wife if
she had turned the car on and found out she wasn't even in the area
where my car was. Since she was the only other one with a key it
doesn't look likely that the tracker was in a position to transmit a
packet at the time it was reported.

Yesterday [5/20/05] I noticed some other reports from other mobile
units that appeared to be delayed or in the wrong place. In other words
I knew they were at point A but they were showing up as still at point
B several minutes later. My car was showing up across town but I was
already at home.

Pardon the Newbie in me for asking but this has gotten me to thinking.
I'm not even sure I'm asking the right questions. Is it possible for a
packet that was sent hours earlier to suddenly show up at a latter
date? If one packet can be seen by more than one IGate how does APRS-IS
know to use only one of the two (or more) packets reaching it? I knew
that RF collisions can keep packets from ever reaching the APRS system
but do collisions occur on the IP side that could remove the packet
from the APRS-IS system?

2576. using older TNC's

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-22 16:54:57 UTC
From: bill2022002
Topic: 2576 Message: 2576

Hello to the group,

I have a couple older packet TNC's that I would like to use for APRS. They are, Kantronics 9612 (not the plus) and Pac-Comm Tiny-2 (not the MR-2).

The Kantronics is running version 5.2 and is working fine as my home unit but, I would like to use it to add UHF to one of our nodes. Can this unit be firmware upgraded to work and if so, where do I find the upgrade.

The Pac-Comm is running an IP version as it was used as a hardwired node back in the early 90's.

Are they work keeping for APRS and if so where can I get the needed upgrades.

Thanks,

Bill
N5WO

From: Robert Lind
Topic: 2576 Message: 2577

There is perhaps another possibility. Have you tried using the free
PC-program AGWPE ?

If not, it is possible that this PC-program and your current TNC
will together work as a newer TNC.
(AGWPE uses quite few functions in the TNC, the TNC is used in
KISS mode only, when AGWPE is used as an interface towards the TNC.)

From: Mark A. Tomany
Topic: 2578 Message: 2578

I just went out yesterday and bought a DeLorme Earthmate LP-20 GPS for my laptop computer. (It came bundled with the Street Atlas 2005 software.) At $74.95 from Fry☐s Electronics, I just couldn☐t resist... (Gawd ☐ I just LOVE that place!!) The GPS is a USB unit. When it installed, there apparently was no emulator that will allow the data stream to be ☐seen☐ by UI-View (or any other program, for that matter) on a virtual COM port. I had an older GPS that did have a COM emulator, but that was a company-owned item and I recently had to return it. (I hope emulator is the correct term)

```
Does anyone know of a small program that will allow the USB GPS to be able
to communicate with UI-View, or be seen on a virtual COM port??
```

Thanks!

I don't think the PK88 can do much. The 1274s can have the EPROM replaced. I thought there was an APRS-oriented replacement, but I'm having a hard time finding it. I'll keep looking. You might join the APRS Sig list on www.tapr.org and ask there.

2587. MacAPRS + Mic-Encode

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-26 15:24:07 UTC
From: kf4gta
Topic: 2587 Message: 2587

Hello list,

I have been dabbling with APRS for the last month since I received my TM-D700a. I went ahead and setup an area Igate using aprsd. The only problem is that when my Powerbook (running MacAPRS 3.7.7) connects to my Igate's raw TNC port via TCPIP it shows any vehicles with the d700 incorrectly. I am thinking that is an encode issue, because I can have my GPS hooked up to the D700 and MacAPRS shows me to be in mexico, while my computer with UI-VIew shows me right where I need to be.

Also, I am the only Igate in my area and there isn't a digi. MacAPRS doesn't seem to recognize me when my D700 is set to wide2-2 but works fine (except Lat/Lon problem) when I set a direct path to my Igate. What would be the best optimal solution for my packet path that will work here locally and when I travel?

TIA

Based on what I've seen on some of the other APRS lists there seems to be a known problem with D700 and Mic-E. I don't have one to try it, but this is a topic that seems to come up often, so try using it without Mic-E and see what happens. Hope this at least gives you some idea where to look

What kind of TNC are you using and what kind of radio.

2591. D700 and $GPWPL output to a Garmin GPS276C

Yahoo group: APRS (1998 — 2006)
Date: 2005-05-30 15:18:26 UTC
From: N6TDM
Topic: 1616 Message: 2591

I posted this in the TMD700A group and figured since it's been a day or two without any replys I would post it here.

Perhaps someone in the group can help.

I have a newer D700A (firmware G2.0) and a Garmin GPS276C(release 3.20/3.21beta). I have mated the GPS cable to the unit and have it working. I figured out in order to get the GPS276C to display the waypoint information that the 276C had to have a route enabled (the hiway map always displays the waypoints). This was in the AM.

I contacted Garmin (since their office is only about 4 miles away) and talked to the support personnel about the possibility of having a modification made to the firmware to support $GPWPL whether routing was on or off. It appears that Garmin actually liked the idea and we may see this in a future release. I did let them know that the application was for APRS.

Now the problem. When leaving the office that afternoon, I no longer see waypoints. I reset both the GPS276C and the D700 and set each unit up. Still no luck. I connected the D700 to my PC and connected the GPS to COM1 (4800,n,8,1) and I observed no NEMA strings being pushed.

I fear the D700 GPS TXD has failed and I need to have the unit replaced (it is 40 days old).

Any ideas or suggestions.

Don

Date: 2005-06-01 21:11:26 UTC
From: John
Topic: 2592 Message: 2592

I have a peet 2100 weather system. I am using the tnc DB-9 radio port to the transceiver and the DB-25 port to the computer. Anyone have expierience interfacing to a KPC-3plus ver 9.0? What cables are needed? Utilizing the GPSPORT command on the tnc, can the data output from the peet system be put on pin 2 of the tnc data radio port?

Thanks for any help

John/N0MEQ

2599. Search and Rescue Applications

Yahoo group: APRS (1998 — 2006)
Date: 2005-06-06 20:58:19 UTC
From: Thomas Gresham
Topic: 2599 Message: 2599

I currently volunteer for the San Diego Search and Rescue communications unit. Is anyone here aware of what APRS equipment is being used in the Search and Rescue field?

I have examined TinyTrak's PocketTracker, but I found that the transmitter cannot transmit beyond the normal amateur frequency range. Our organization uses the 147-148 MHz range.

We already possess many radios and GPS units. Being a volunteer organization, we do not have the funds to purchase additional radios with built-in TNC's like the Kenwood TH-D7AG. We may purchase TinyTrak units if we can determine the list of compatible radios.

If anyone has any suggestions on TNC's please let me know. Thanks!

You may not use amateur radios. Your radios must be type accepted for the public service frequencies. Contact you radio support people in your municiple offices or county offices.

From: N9WYS
Topic: 2599 Message: 2602

Tom,

I also volunteer to my county's EMA. I have researched using APRS for SAR, and have decided the easiest way to implement this is to use the TinyTrak unit with some of our agency radios (non-ham). We have a bunch of UHF Motorola MT1000's (and licensed one freq on UHF) so this will be my test-bed radio. I haven't built all of the interface cables needed (we plan on about 6 - 8 units for initial field testing) but plan on getting started in the near future. The county's primary radio system is an EDACS trunked 800 MHz radio system, but the trunked system's audio CODECs render APRS and packet unusable using conventional interface methods - unless we invest in the EXPENSIVE interface cables provided by the system vendor.

Using amateur radio frequencies and radios limits you severely - you'll need a ham to operate each portable unit, plus the receiving station in the SAR command post. With agency radios, you simply have more options.

Mark - N9WYS
Asst. Chief - Field Services, Will County (IL) EMA

To stay legal, you would need to make sure that the FCC-defined radio service you intend to use allows data. If it does, then there's no particular limit on 1200 baud TNCs. As long as you can get audio to and from the TNC, you can probably make it work. 9600 baud needs a connection to the guts of the radio, but 1200 should work OK with the available external connectors.

You wouldn't need a ham on the receiving end as long as the station was receive-only.

As for the transmitting end (APRS tracker), this is a debate that pops up from time to time in various APRS forums. The leading interpretation says that an APRS tracker qualifies as an "automatic" station. Under that rule, the "controlling" operator doesn't actually have to be physically present at the transmitter as long as he has some "out-of-band" method for turning the transmitter off if it gets messed up. This "out-of-band" could easily be the operator calling the nearest person on a different radio and having them shut off the tracker. This would certainly allow the use of APRS in an SAR situation.

Digital stations are covered under 97.221 APRS station apply as well and may operate "automatic".

As has been stated below and by others, you must use type accepted radios. If your municipal radio shop doesn't have the radios, you can check the surplus/used market for them. I found Maxxon 4000 (16 ch VHF programmable radios) that work fine for both ham and Public Service operation and have begun deployment of a APRS system for the local EMA and Fire Protection Districts. We haven't performed much testing yet with the HT's. I am sure that they will perform excellently.

Check with Pacbell (SBC) comm shops and explain what your situation is. They may have some older TMRS (Telephone Maint. Radio System) VHF radios that they have not scrapped and may be willing to donate. ?? You won't known unless you ask.

APRS Ready radios. good battery on each and antenna. These are 6 channel radios with CH 1 programmed as 144.390. They have the speaker mic dust covers that can be made into a radio cable for a TNC or a Tiny Tracker to get you on APRS quick! I'll include a pinout sheet on how to connect it up as well.

The other frequencies are in the Amateur band as well ex CH 6 is 154.600 MURS

$55 each shipped UPS. I have 2. Paypal prefered and I can accept cards there as well.

Write off list.

>Now what about in a LIFE OR DEATH situation? Read the rule on that and tell me if you can or cant use NON-Licensed or NON type accepted equipment...

In such a case, I'd think that the US authorities would accept the use
of any radio equipment suitable for the operation. Our authorities
would. In a REAL emergency situation.

In the United States it would be if the person using the radio is in peril any means to convey emergency, May Day, PAN PAN or whatever you want to call it may using any communications device at their disposal. However those participating in a search and rescue situation must use type accepted radios for the particular service they are operating in with the exception of amatuer radio operators they may use any modified radio they want but can only communicate with anyone else on the ham bands. This does not mean they may use a 2m radio that has been unlocked to transmit out of band to talk to other serachers on a service outside of the ham band and visa versa.

As has been stated below and by others, you must use type accepted
radios. If your municipal radio shop doesn't have the radios, you can
check the surplus/used market for them. I found Maxxon 4000 (16 ch VHF
programmable radios) that work fine for both ham and Public Service
operation and have begun deployment of a APRS system for the local EMA
and Fire Protection Districts. We haven't performed much testing yet
with the HT's. I am sure that they will perform excellently.

Check with Pacbell (SBC) comm shops and explain what your situation
is. They may have some older TMRS (Telephone Maint. Radio System) VHF
radios that they have not scrapped and may be willing to donate. ?? You
won't known unless you ask.

Hi Robert,

I'm confused? Lets get back to real world for a moment. First of all lets say that the Licensed Ham with his APRS tracker is lost. The Search and rescue group do not have to be hams to find the lost ham. They can use receivers hooked to a tnc to view the packets being transmitted by the lost ham, no license needed. This is a receive only search.

The only one with a FCC license is a Ham radio operator that is transmitting. Again in an emergency situation you may transmit emergency communication licensed or NOT, 97.405. But in this situation everyone is Legal. There's obviously more to this for later discussion. Hope this helps and I hope to hear from others on this. It got me to reading my FCC rule book again hihi.

The issue is: can a non-licensed person be carrying an APRS tracker that transmits on its own? The answer is "Yes". The tracker is considered a station under "automatic control" (see 97.109).

You must have a valid amateur radio operators license to control any device that transmits in the amateur service.

2620. Re: [APRS] Search and Rescue Applications

Yahoo group: APRS (1998 — 2006)
Date: 2005-06-12 19:22:55 UTC
From: Robert Lind
Topic: 2599 Message: 2620

I think that the rescue workers should at least be under the
supervision of a ham, if they do use APRS to keep track of each other.

My reasoning:
To go out on a rescue mission, using APRS, should (if possible) not use
an "emergency clause", because there is normally plenty of time in
advance to prepare for the use of APRS, at the next future call-out.

An "emergency clause use" is for me like seeing a ham transceiver in a
cabin in the wilderness (and you are not a ham), and you use that
transceiver to call for help, at a emergency.

2621. Re: [APRS] Search and Rescue Applications

Yahoo group: APRS (1998 — 2006)
Date: 2005-06-12 22:04:08 UTC
From: Phil Reed
Topic: 2599 Message: 2621

True. But "carrying" is not the same as "control". For that matter, how are trackers on near-space balloons "controlled"? There's no ham on board.

97.109 (d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations specifically designated elsewhere in this Part may be automatically controlled. Automatic control must cease upon notification by a District Director that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the District Director.

If the tracker starts transmitting improperly, you contact the person carrying it and tell them to turn it off.

They have been sent by a licensed ham. All amateur stations must have a control operator designated. Under normal thought such as repeater or simplex phone operaton a control op is designated. An ordinary control rules apply as you are suggesting however in the last 90 years or so since radio has begun technology has allowed a great deal of metomorphisis requiring changes in regulation.

Digital radio has now arrived an the rules have been changed to accomodate. Part 97.221 is Automatically Controlled Digital Stations.
An APRS station qualifies as a station responding to interrogation by anther station that is either controlled or qualifies itself under the same rule (another APRS station)

An it's emission may not exceed 500 Hz. Phone is as wide as 6 KHz so that is how phone stations may not operate under this rule.

Read that section of Part 97 and you should see clearly how it is accomplished this way. This is why a ham may put an APRS station in his car and his non-lisensed wife may drive around in it while he is not there and still operate it completly within the rules.

Bob

2623. Spatial Data Needed for MapPoint

Yahoo group: APRS (1998 — 2006)
Date: 2005-06-16 20:35:09 UTC
From: Thomas Gresham
Topic: 2623 Message: 2623

Dear Forum:

Thank you for all your responses to the Search and Rescue Question. Your information has been very much appreciated.

I would like to know where I can find spatial data for specific counties. We are currently using Microsoft MapPoint with APRS to track our teams, however we require topographical information on our maps. Does anyone know where I may download .shp or .mif datasets for San Diego county? This data is free from the USGS, but in an unseable format (.dem).

If anyone has any information, I would really appreciate it.

-Tom-

2624. Pre-Newbie... HI! Need a little help with packet protocol

Ok guys.. I'm a big newbie to packet so be patient. I assembled a TinyTrak... wow great little device. Now my GPS will not be in until Monday so I thought I would poke around and try to get the TinyTrak to send a fixed packet with my location. Looks near right to me and I transmitted the packet on 144.390 here in metro Atlanta Area. I can hit about 30 repeaters from where I am located so I dont think the transmit is a problem and deviation seems to be fine. But if I try to track on findu.com or by using my UI-View32 I cannot. It is like I am not being received, or perhaps my packet is not right???

Below is a copy of my packet recorded with Mix32. Please, comments and recommendations are most appreciated.

Tnx, Scott KG4WEL

Topic: 2624 Message: 2629

Well that is probably my problem, I entered the position in the comment field, and I think the syntax is not correct and is being ignored. Here is a screen shot of my tinytrak setup. I just was playing around with doing it while waiting on my GPS to arrive.

Now the only other funny thing, I also have installed UI-view32 and have it interfaced via KISS to Mix32. If I broadcast my location via HF on 30 meters on 10.151, then my fixed location shows up immediately on findu, with the relaying stations call in the raw packet. However if I broadcast the same packet (data rate changed to 1200bps) on 144.390 I get no relay. So I don't know if I am doing something inherently wrong in either setup, TinyTrak or UI-View, to get relayed on VHF.

Here is the screen shot of my TT3 setup.

http://www.supperclubnet.org/image11.jpg

One thing I am not clear on is the digi path, I assume something like Wide2 means 2 relay hops, wide3 is 3 hops??? not sure if I need anything else in the path.

I've been sitting looking at the local packets this weekend off my 2 meter and a beginning to understand what are digipeater relays, others that are the simplex stations, some info I do not understand at all, like APxxxx/ , the protocals beginning with AP and the like.

Thanks for your help and advise. Scott

I see this.
http://www.findu.com/cgi-bin/find.cgi?call=KG4WEL-2

Let's get together and debug. I need another pair of eyes on my TT3 by
someone who has built one too. I'm in Marietta.

There is deff. somthing wrong. The packet is structured wrong.

It should be somthing like:

KG4WEL-2>APT311,WIDE2:=!3363.10N/08369.57Wb/ <then comments here>

Are you sending this with the TinyTrak III? I ASSUME so since it has
a the APR311 Tocall.

Yep, I was playing around last night testing UI-View and an IGATE, so it relayed my own packet from UI-View via the Internet. The earlier findu records are gone right now, but nothing off the TT3 made it to findu, even though I can decode it over MixW. I think it is just because I don't have a GPS on it yet. My GPS will be in tomorrow, so will let you know how it works. send me your email directly and I will let you know how it develops.

2633. Re: [APRS] Re: Pre-Newbie... HI! Need a little help with packet protocol

Yahoo group: APRS (1998 — 2006)
Date: 2005-06-20 20:03:11 UTC
From: Scott Granholm
Topic: 2624 Message: 2633

Yep, I think it is because I was fooling around trying to force a location in the comment field, I'll wait for the gps to come in tomorrow and check it again, I think the > instead of the = has most to do with it, as I look at raw packet, and it looks different when directly received than on findu, it seems the FO: is followed directly by "=" or "," and the coordinates, then a > and the comment. I feel possibly findu is disregarding the packet since it is not complete, that or I am not reaching a digi-peater or Igate with my signal, which seems odd, I live is a large metro area and am testing with not only the HT but also with 60 watts on a ground plane from home.

so I think I am missing the =!3363.10N/08369.57Wb/ , if I had the GPS under the current TT3 configuration I think it might read *similar* to...

KG4WEL-2>APT311,WIDE2:=!3363.10N/08369.57Wb-/!3363.10N/08369.57Wb

Of course I am going to remove the text coordinates in the comment filed and replace them with something appropriate.

Hey, thanks so much for you help and info, I am learning a lot... this is my first plunge into packet and APRS.

APRS is just so darn useful, I am trying to rig my bicycle so when I go on 50 to 100 mile bike rides my XYL can track me, and if I should need assistance she can drive out and know exactly where I am. It's also very cool! I'm hoping it will be my project for field day.

Scott, keep in mind with the TinyTrak III, it will
default to MIC-E encoding so when you get a packet
from it, it may still not look "correct". It will
look like you have some ASCII garbage.

We'll use my Buddy Wes as an Example:

KD4RDB-14>SS5W8X,WIDE1-1,WIDE2-1:'l6: {'j/]"4T}
------ --------------

I underlined the MIC-E parts.

MIC-E takes the Lat and Lon and converts them into a
binary equivelents to reduce the size of the packet.
the TOCALL is then replaced with the LAT and the LON
is stuck on the back end of the packet, just past the
path. You can also have a position comment past that
point. You won't find any human-readable LAT or LON
in the packet, so don't get worried.

hi
i need to contact the sysop of
ontario.aprs2.net
anybody knows who he is?
i am operating an Igate here in eastern Quebec,when connected at
ontario.aprs2.net no stations that i relay seems to be "visible".
If i connect ve2pkt.dyndns.org,,,there you wil see them.

that is why i need to contact the sysop,could be a matter of setup.
or i had an other server to connect??

thanks for the QSP

Hi Gervais

It is working fine for me. I beleive you are using the FILTER command, check if the syntax is Ok and if your Internet validation number is entered.

here is the filter that work for me

FILTER P/ve/va F/ve2wmg-9/50

From: Mark Kimber
Topic: 2635 Message: 2641

Try http://www.packetradio.com/wiring.htm

They seem to have wires for everything, click on add to cart to see the diagram;

Specific to Kamtronic s is

http://www.packetradio.com/wiring.htm#KANTRONICS

Subject: [APRS] KAM Pinout

Hello everyone,

I am trying to get back into aprs, unfortunately I lost the diagram given to me with the KAM TNC that i got from a friend a while back. Can anyone help me with this?

Thanks,

Scott DeSantis KB9VRW

Scott,

If you don't get the info you need from the other links shown, contact me off list and I can arrange a copy of a few pages from the KAM manuals. I have a few of the these units and some manuals.

hi
i am working on a digi i just installed and it need setup.
i can connect it remotely but after 3 to 5 minutes it deconnect
itself,,,

we can not see it on the map but it is ON,it doesnot relay any data at
all,bizarre,,
it is like if it was on Packet mode not in APrs mode

thanks in advance for your help,i will appreciate a lot,,,
the radio is 2 hres from home and in the wood.

KG4WEL-2>SS5P8X-1,KC4ZGQ-2,WIDE1*,WIDE2,qAO,W4AP-8:`p(!o+k#/"7O}KG4WEL Portable

Tnx, Scott

The First part of the Packet 'KG4WEL-2' is the callsign with an SSID of -2 The packet from '>' to the first ',' 'SS5P8X' is the Lat info and the hemisphere Offset (as well as some other info), the info from the Lat to the ':' is the Digi/Path string. The ' ` ' symbol is the ID indicating it is MIC-E compressed data and the characters 'p(!o+k#/"7O' decode into the Lat, Lon, Symbol, Speed, Course, Altitude and the message after the } is a comment field.

So the station came through the Digi KC4ZGQ-2 and W4AP-* using a Wide 2 path.

His Packet appears to decode as Lat 33.848 N Lon -84.20083 W , traveling 40.27 MPH on a course of 82 deg with a symbol of Green Star (often replaced with a blue tower) indicating the station is a Digipeter. It appears to put him in Tucker, Atlanta.

Hope it helps.

2647. UI-View32 problem, IGate stopped RF to Internet

Yahoo group: APRS (1998 — 2006)
Date: 2005-06-27 10:46:08 UTC
From: Scott Granholm
Topic: 2646 Message: 2647

Hello, I set up my local pc here for an IGate, it does help me with my bicycle APRS. The IGate suddenly stopped working last evening while testing sending message via packet to a friend. I am new at packet and APRS so please excuse my spotty knowledge.

VI-View32 has been working flawlessly for an IGate. The software is interfaced with MixW as a software TNC via KISS and emulated serial ports which works well.

Last night while trying to get a message to ACK over TCP/IP, which I never did, and after re-connection to server I received a message in the message box, like I had sent it but I did not, I think maybe UI-View sent it or maybe the server? I don't understand the message but when it popped up coincides with when the IGate function stopped. Here is a copy of the message.

This popped up in the UIView message box...
KG4WEL |<A>| No stations have been heard except via a digipeater.

This popped up in the UIView message box.
Does this mean the software has stopped because I have not relayed any local stations? very weird, but now the IGate will not gate the received packets back to the Internet. I have tried several servers but still no go, it is acting like the software did before I entered my server authorization number. No other configurations have changed and the TNC interface seems to be working.

Ok, any thoughts or tips?

Thanks, Scott KG4WEL

2648. No APRS coverage east of the Sierra Nevadas ;(

From: Jason
Topic: 2648 Message: 2648

I took a trip to Yosemite and back from SoCal, I5/I99
on the way up, 395 back down.
I was supprised to have good Digi coverage in the
Yosemite valley itself, I was even hearing stations
from over 200miles away via the Digi near the entrance
of the park.
We left through Tioga Pass and had a little coverage
near the 9000ft mark, but nothing on the 395 until well
south of Lone Pine some 250miles+ away.

http://www.findu.com/cgi-bin/track.cgi?call=KG6TWI&start=500°ree=4

Garmin eTrex/Kenwood TH-D7a(g)/+2db mag mount

Talked to a few Hams on the 395 on local 2m repeaters, but only 1 or 2
had even heard of APRS. I don't expect a Digi going up anytime soon.

I personally do alot of backpacking in the Eastern Sierras and would
love to have APRS coverage when I'm up on the mountain, just to let my
family know where I am, and in a worse case, the S&R team.
The only thing I can come up with for a temp per-use basis would be to
buy a D700 for the truck and make it a Digi with a beam pointed over
to Vegas or south twards SoCal, luckly most of the parking areas for
the mountain campgrounds are @ 8kft+ making it easy to get over the
mountains to the east.

Jason,

Right you are!!

You came right by my QTH on your return trip. On Gov't Peak by Randsburg, CA (about 20 miles south of Ridgecrest, CA)is WA6YLB-4, a digipeater with WX. My home station KI6LO-10, in Ridgecrest is on 24x7 as a relay for local needs with RELAY, WIDE2-2 in the pathway. It's true that there isn't anything past the Indian Wells Valley (Ridgecrest area) until you get way up north of Mammoth, CA area. Take a look at the APRS coverage map and you will only see mobiles up to my area on Hwy 395 and then blank further up the highway.

There was talk a couple of years back of the Southern Cal Edison radio club putting in a digipeater to cover up into the Owens Valley (Lone Pine?, Big Pine?, Bishop?) but I haven't heard narry a peep out of anyone for a long time.

It would be nice to have coverage up into the Owens Valley as I travel up there regularly going fishing.

From: Sean Smith
Topic: 2654 Message: 2654

Hi there, I'm looking for small 1-2w transmiters that I can pair up with a Tiny Track tracker. I'm trying to build Trackers for our SAR group that are self contained. I've played with the pocket trackers but up here in Northern Alberta we aren't blessed with hills so the low power out put doesn't get to far. I've thought about figuring out a linear amplifier circuit for the pocket tracker but I thought I'd see if there was an off the shelf solution I could use.

Thanks
Sean, VE6SAR

Yaesu has a small transceiver called VX-2R with a maximum output of 1.5 W.
See http://www.yaesu.com

TinyTrak3 does exist in a surface-mount version that is 1 inch by 1 inch
wide,
and appr 0.15 inch thick. Perhaps you could insert it inside the radio?

You might want to consider a small HT. The use of a receiver will reduce the chances of packet collisions.

You could also have a look at Hamtronics http://www.hamtronics.com/

They do a 2W (output power adjustable) kit Model TA51 which would do what you want.

From: John
Topic: 2654 Message: 2659

Dear Sean,

I've used both the Pocket Tracker and a VX2R by Yaesu. Here's my thoughts on both:

Pocket Tracker: Neat self contained package, but need to carry extra batteries or have a power source for the GPS itself. Some of the smaller GPS packages can be used on a 9V battery for a sufficient amount to time. I am toying with taking it out of the Altoids package and putting it in a slightly larger box and adding additional rechargable batteries and an internal GPS so the entire unit is about the size of a medium 2m handheld. Down side is that it's very low output, and no reciever. Lack of a receiver negates the use of an amplifier because of packet collisions. The low power seems to be a problem for you.

VX2R: My first choice for a very tiny package. I purchased a SMALL Pelican box and fit a VX2R in it, with a charging circuit. I fitted a waterproof feed thru on the end of the Pelican, and there are 3 exiting small guage wires. One is to a cigarette plug from R/S with a 9V circuit in it, that at this point powers the entire tracker and recharges the VX2R. A second wire goes to the GPS receiver and a Tiny Track SMT mounted in a 1 cubic inch plastic box(velcroed inside a car window). The 3rd wire goes to a small Larsen 1/4 wave verticle mag mount. This setup works extremely well and it gives me the added bonus of having a spare handheld in an emergency. My next go around with this setup will be to use a Pelican box totally self contained, by making the charger outboard, adding a small battery bank to run the GPS and Tiny Track, mounting the GPS in the Pelican, and only having a 1/4 wave antenna attached to Pelican. I will try a simple piece of flexible wire or tape measure) cut to 19 inches and cover the inside of the box with conductive tape for the couterpoise. This 2nd setup would be very usable in a backpack while hiking. Setting the timer for 15 minutes or so would give a very long battery life.

These are just a few of my thoughts based upon real experiences and if you want to contact me off line for any other info feel free to so.

You might want to consider a small HT. The use of a receiver will
reduce the chances of packet collisions.

There are a couple of companies on ebay that are selling made in China VHF tranceivers that cover the 2 meter band. One is located in Hong Kong and charges an outrageous amount for shipping (More than the radio will cost) The other is out of New York and charges a flat rate shipping. The radio is keypad programmable and has CTCSS tones and a nice drop in charger. It puts out 3 watts and the antenna connector appears to be a BNC. I bought one today for 27.00 If nothing else I can program in the MURS frequencies and use it to yell at my kids. However I plan to connect it to the tinytrak to make my station a little smaller. I'm currently using an IC-02AT brick and it takes up a lot of room. Also if it gets stolen from my car I'm only out a tinytrak and a cheap radio. A decent IC-02 will still run between 40 and 90 dollars even thought they are 25 years old. So if the el-cheapo chinese radio works it will be great for the price. I have included the URL to one of his current listings.
http://cgi.ebay.com/ws/eBayISAPI.dll?
ViewItem&category=4674&item=5787256655&rd=1

The URL is all one line

Hi everyone on the list .. Just to let you know that Lee Grevemberg (KC5AHA) put up the digi on 7/1/05 on the Rosepine Tower about 400 ft up the tower (about 635 feet above sea level) and from the get go was bringing in stations from central mississippi .. This digi is running a KPC3+ with 9.1 rom and using the wide N-n format and doesn't seem to be having any problems that we can tell, the radio is a commercial kenwood with about 65 watts on the output and a great front end.. Please advise if there are any tweaks we need to do... I hope that this helps the state in general for a good east/west link .

The URL spec has allowed for word wrap if you play by the rules,
and if your mail reader plays by the rules...

The spec says just put the URL inside arrows:
<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4674&item=5787256655&rd=1>

BTW on eBay pointers that have the &item=number you can leave
out the &category=nnnn string and the &rd=n.
Compare the below with the above.

<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5787256655>

UI-View16 may work. If you connect to the APRS-IS make sure you filter
your feed, that machine will NOT be able to handle the entire feed.
http://www.ui-view.org/#ui-view16
I use this filter:

filter r/36/-97/500

Make sure you connect to the filtered feed port, 14580
Good luck!

I run UI-View32 on a 75 MHz Pentium with 40MB ram and Win98SE.
It ran with 16MB, but the increase to 40MB made it faster. I use
a Paccomm HandiPacket TNC in KISS mode.

If UI-View32 won't run the 16 bit version should.

2677. USB interface info

Yahoo group: APRS (1998 — 2006)
Date: 2005-07-10 08:41:13 UTC
From: Robert Lind
Topic: 2668 Message: 2677

Many times APRS users have asked for a converter, to be able to
use an USB-only GPS-receiver with a TNC that only accepts
RS-232 (V.24) to it from the GPS.
Perhaps the cost of such a converter will be higher then buying
a new GPS receiver that can output RS-232, but ...

A check with Google show that there are chips available that can
handle the low level of USB, without assuming they are inside a PC.
For example the TD242LP, see
<http://www.transdimension.com/>

But even with this type of USB chips, it is not a small task to create
the software to handle the USB connection from the converter to
the GPS receiver.
Not even if the only purpose is to get your position from the GPS
receiver and sent it out, unchanged, on an RS-232 port.

2680. KPC-3 v8.2

Yahoo group: APRS (1998 — 2006)
Date: 2005-07-11 01:55:28 UTC
From: n9wys
Topic: 2680 Message: 2680

I have an older KPC-3 that I recently upgraded to the v8.2 firmware. I've read the manual addendum that applies to this software, but I still have a few questions. My home station is currently running UI-View with this TNC.

In order to continue reporting location information, do I need to keep UI-View running, or is there a provision (or string) I can configure the TNC for to allow the station to operate without the computer running 24/7?

I thought I saw a configuration format for this type of TNC listed before, but I can't sem to locate it now. (Showed suggested parameters for the new commands.) Was it posted on this reflector?

Can anyone who is sucessfully running this TNC "stand-alone" give me some direction? It's working fine with the computer connected 24/7, but the computer is not on a battery backed-up supply, so every time we lose power, I lose the station until the next time I cna reset the computer. (Usually happens during the night or when I'm at work.)

Thanks!
Mark - N9WYS

Hi Mark,

Yes you can turn off your UI VIEW and it will configure your TNC for packet mode. You need to make sure thou that it has the correct configuration thou. Make sure that your beacon, blt, ltp, bt and any other pertinent commands are correctly configured when you close UIVIEW generally you won't have any mistakes and it will run fine without your PC running. At this point you are just running a beacon with a GPS coordinates in the BT beacon text command. I am assuming that this is just a HOME station and not a mobile station?

If you want to see if your TNC is configured correctly open up a dumb terminal program and see what commands are configured at, something like HyperTerminal or procomm plus. You should have something like that on your computer if your running windows.

UIVIEW has a station setup, and a com setup these need to be correct before closing UIVIEW.

Any more questions just ask the group again and I'm sure that someone will help you.

73 good luck

Mike
my old Ibm Portable is just an 486 dx???? i dont recall the mhz.
it is running win95 quite good but win98 se is impossible.
i tried to install it and refuse,not enough cpu

i will try the 16 bit version with this portable

2684. IN DASH DigiTraveler

Yahoo group: APRS (1998 — 2006)
Date: 2005-07-12 03:40:09 UTC
From: Scott W7WRO
Topic: 2684 Message: 2684

FYI only. Try at your own risk. Not responsible.

I have put my DigiTraveler in the plastic DASH of my 2005 Chevrolet Silverado Pickup. I have placed the DigiTraveler inside my Dash board by opening up the Glove box and placing the DigiTraveler mounted between the top inside of the dash between the vent pipe and the right defroster vent (again all plastic). Lots of empty space underneath.

Also right below on the right underside of the glove box I have placed my Icom T81a HT and KPC3 TNC with belt clips attached to the heater cover plactic underneath the dash all out of site.

If your wondering how this has been working out, for me I can say it has worked better than expected. What gave me the idea was my DigiTraveler was sitting on the right side on top of the dash in the hot sun. Consequently the DigTraveler was acting funny and I came to the conclusion that it was getting to hot. Thus putting it in the dash protected it from the direct sun. The benefit was no one could see my tracker yes.

Again I wanted to share this with the group because I felt it would be useful to others trying to find a place for their tracker and other equipment. Also using a TinyTrak 3 this could be even easier to hide your tracker. Out of site out of mind.

I would of had pictures but then I didn't figure the group would want to see a picture of a Chevrolet Dash Board HIHI.

73 hope you enjoy

I assume you are running a dumb tracker right now.
Since you have the GPS and KPC-3 already in place,
looks like you need to build a HamHUD II and put that
in there to work with them and you'll have a full
tracker WITH SmartBeaconing, 2 Way Messaging and an
easy way to monitor your local APRS traffic.

Just a suggestion :o)

2686. RE: [APRS] KPC-3 v8.2

Yahoo group: APRS (1998 — 2006)
Date: 2005-07-12 07:13:38 UTC
From: N9WYS
Topic: 2680 Message: 2686

Scott,

Yes, this is a base station - not mobile. And I gather from your message that I can place my LAT/LON coordinates in the BTEXT comment, and this will place the coordinates in the UI string that is transmitted? Cool!! That will "release" the computer for other functions. (I used HyperTerminal to configure the TNC before connecting it to UI-View, so I'm good there, too.)

Thanks!
Mark - N9WYS

Subject: Re: [APRS] KPC-3 v8.2

Hi Mark,

Yes you can turn off your UI VIEW and it will configure your TNC for packet mode. You need to make sure thou that it has the correct configuration thou. Make sure that your beacon, blt, ltp, bt and any other pertinent commands are correctly configured when you close UIVIEW generally you won't have any mistakes and it will run fine without your PC running. At this point you are just running a beacon with a GPS coordinates in the BT beacon text command. I am assuming that this is just a HOME station and not a mobile station?

If you want to see if your TNC is configured correctly open up a dumb terminal program and see what commands are configured at, something like HyperTerminal or procomm plus. You should have something like that on your computer if your running windows.

UIVIEW has a station setup, and a com setup these need to be correct before closing UIVIEW.

Any more questions just ask the group again and I'm sure that someone will help you.

73 good luck

From: Ronny Julian
Topic: 2687 Message: 2687

Anyone else tried one of these adaptors? I got two of them for $9.99 each at Microcenter here in Atlanta. multiplexes one USB port into 4 and also add TWO DB9 serial ports and a Parallel port as a bonus! It's active (wall wart) so it may not be a great mobile device unless it's modded for DC only or used off an inverter.

I already had a COM 1 and my cellphone GPRS connection is COM5 so it assinged this as COM6 and COM7. I asked if they had any others but got a "I dunno". I bet a call to the store manager could yield a few more at the same price if anyone wants more.

The part # reads P54000. If anyone needs more info please write off list. If anyone else uses one of those and has a portable power adaptor solution aside from the stock wall wart let me know too.

Check out any station on findu.com such as:

http://www.findu.com/cgi-bin/find.cgi?ke4nyv-15

Steve has google maps working with the find.cgi
script.

Sounds like you need to join the tapr APRS group,
there was plenty of talk on this a couple weeks ago.

there used to be another program exactly like google earth, called
TerraExplorer...
and as for linking GE to the ARPS servers... well, them or someone will have
to find a really good CODEC for the APRS data, and a lot of options, like
show only the persons w/ APRS in partiular areas.
if you think about it, thats a LOT of data to sent over the net..
BUT, hey maybe someones up for the task...

Click on the Satelite view link. Much better than Terraserver!

Google is one of those outfits that sits back and waits till everyone writes
cool features. They then go and do it much better! Gmail is a great
example also.

I have paid for and use Google Earth Plus, great program, but It only reads waypoints, tracks and routes from Garmin or Magellan GPSr's

You can import CSV files though, and you can make files that point to a location that opens in GE, but from what I can tell, it doesn't even listen for NMEA data, it only transfers stored data from GPSr's.

You need a fast internet connection to even use GE so I can't imagine using it on the road. I guess we'll just have to wait for a plugin.

In this area (NYC) it appears that the Google Maps, and FINDU and anyplace else using the Navteq mapping, give my location incorrectly by 0.16 miles, two city blocks off real WGS84/USGS/GPS position.

I've asked Google and Navteq for a response on this. They may be using the TIGER maps for their baseline data, or making the same incorrect assumptions that TIGER did. The US Census knows of this error, and states that TIGER maps are not suitable for navigation.

Caveat emptor, folks. It's still betaware.

Anybody interested on doing what Steve is doing with findu, here is a link that gives a tutorial on how to create a custom google map. I have been trying to keeping an up to date version on my website, unfortunately the API is not officially supported and they seem to make breaking changes every few weeks.

http://stuff.rancidbacon.com/gmaps-standalone/

I should also warn that a far knowledge of Javascript is required, if anyone needs help email me off the list and I'll provide any assistance I can.

Subject: [APRS] Google Maps [was] Re: Google Earth

In this area (NYC) it appears that the Google Maps, and FINDU and anyplace else using the Navteq mapping, give my location incorrectly by 0.16 miles, two city blocks off real WGS84/USGS/GPS position.

I've asked Google and Navteq for a response on this. They may be using the TIGER maps for their baseline data, or making the same incorrect assumptions that TIGER did. The US Census knows of this error, and states that TIGER maps are not suitable for navigation.

Caveat emptor, folks. It's still betaware.

Has anyone considered a program similar to MapTool to grab Google maps and use them in UI-View or other APRS programs? This sure would make it easy for some users to create maps for use with these programs.

Have some questions, wondered if I could lean on you guys for some answeres.

Ambient Weather software was successfully installed on my computer. How can I make A. W. generate textfiles that can be read by UI-View32? Both an e-mail and a phone call to Ambient Weather went unanswered (so much for their tech support). Any ideas from anybody out there?

By the way, welcome back OM KE1LB.

Second question: The website for UI-View32
(http://groups.yahoo.com/group/ui-view/) has the same format as this
one, i.e., you sign in with a username and password, "Hello n1jxp"
appears at the top of the page, and you are supposed to be able to
click on group files on the left. Even though I have no trouble
logging on, I cannot access the files. Any ideas?

If you are asking about how the UI-View list is behaving when you log in to the list's web site, I can tell you that it is behaving in such a way that you will be able to access the files section.
You will have to be a list member to have access to the files and to be allowed to post messages.
To become a list member, you send an email to ui-view-subscribe@yahoogroups.com. After some checkout messages, you are allowed to post messages and you will get all new messages as email (like most yahoo groups).
To get access to the files and the messages archives, you need to have a yahoo! ID.

Lew I have no other solution other than the use of that reset line on the connector. I have had to do this on my commercial unit a few times if it has been under cover from GPS for a few days (Parking garage). On our commercial units we reset this line with a remote output on the cellular side IE: A reset command over the air.

I wonder if the antenna charateristics have changed? I have another Trimble I can get to you next week. No problem there.

I think I an help Mike out Eric.

Mike, what version VWS software are you using from Ambient and are you
using the internet edition?

I am using V 12.07, internet edition which gives you the option of
spcifying where you wish to save the wxreport.txt file. Look under
main menu, Servers-->APRS. Check Create APRS file every minute. Choose
UTC or local time (local works best here for Ui-View). Finally open
file folder to tell VWS where to save the wxreport.txt. I save it in
the data directory under VWS but you can save it anywhere as long as
Ui-View can access it.

Open UiView, select Setup--> Weather station setup. In WX data file.
enter the path to the VWS wxreport.txt file by either browsing to
choose or typing the path in the text box. I use Max age 15 mins. but
if you choose UTC for your wxreport.txt in VWS, you'll need to set max
age to 0. Close Weather station setup box, if all went well, you'll
see Ui-View send a beacon with your VWS data.

There is a separate APRS module you can download from Ambient but that
module is for stations wishing to send Wx data to aprs server(s)
without the use of an APRS client such as Ui-View.

You should be set to go. I think you need to use the internet edition
to generate the wxreport.txt but I'm not sure.

HTH,

Randy, W7RSW

2724. APRS on UHF?

Yahoo group: APRS (1998 — 2006)
Date: 2005-07-29 18:09:38 UTC
From: Jason
Topic: 2724 Message: 2724

I have a spair Motorola Radius SM50 laying around, but its UHF. Any point to me making it an APRS rig? Do any iGates operate on UHF?

I'm not even sure what the official aprs-uhf freq is? 445.925?
I would assume that I would still use 1200baud.

Jason,
In downstate Illinois 445.925 is used for 9600 baud APRS.

Al,

2726. another UHF APRS question

Yahoo group: APRS (1998 — 2006)
Date: 2005-07-31 07:23:54 UTC
From: Phil
Topic: 2726 Message: 2726

Hi,

I'm in Australia and was interested in using the tiny trak system from byonics.com to transmit the position of my up coming weather balloon experiment

http://members.optusnet.com.au/~philpawlowski/

Problem is that I do not have a ham licence and associated equipment. I do have a portable UHF radio (exempt from a licence in oz) but no modem TNC.

Not really sure where to start. I understand that one's sound card can be used?

Is it simply a matter of getting the right software to pick up the signal transmitted from the tiny trak?

I already have a mapping program I just need the coordinates of the balloon to be shown on the laptop in the chase vehicle.

Regards,
Phil

A TinyTrak and a UHF radio on the balloon, and a UHF radio and a TNC on the ground. Same as a regular ham setup, only on a different frequency. I'm in the process of setting up a similer thing for a friend who wants to track his 3 kids on their ATV/Quads as they ride in the area around his house. A Motorola HT1000, TT3 and a GPSr on each quad plus another HT and TNC at his house connected to his computer. The radios are in the 451mhz range as he, nor his kids are hams.

Phil, to track the balloon directly you would need two radios. One on the balloon, along with a GPS and TinyTrack. The TinyTrack is just a special type of modem, that allows you to send digital data from the GPS over the radio. All three components are needed.

At the receiving end you would need a second radio to receive, and you can patch the output from that into your sound card with AGWPE so that your computer can display the data using other APRS software, such as WinAPRS or UI-View. Each of the APRS software packages is, ah, unique. AGWPE also sometimes can be difficult to configure (and sometimes painless) and the "pro" edition apparently is more robust.

Before you run out with the shopping list, you also need to confirm that sending digital data is legal with your radio type. Sometimes it isn't legal on license-free radios and only voice information is allowed. Since even a low-power transmitter on a balloon may reach out for hundreds of miles once it is at altitude, that's something to be very certain of.<G>

There is a differrence between technology and legality here.
I don't know about WinAPRS, but the use of UI-View is strictly
restricted to licenses radio amateurs as part of their hobby as radio
amateurs, and therefore illegal (as far as the program licensing goes)
for other use. This restriction is set by the program author. (see the
comments to Phil's similar request to the UI-View list.)

Jan-
<<UI-View32 is for use only by radio amateurs, as part of their hobby of amateur radio. Commercial use of UI-View32 is not permitted. If you wish to use UI-View32 for commercial purposes, then ask me about obtaining a commercial licence.>>
From the UIV32 LICENSE.TXT file. What the author goes on to say is that this is "versus" COMMERCIAL users who require a commercial license. Since the author was English not American I canot be certain of his writing, but in the US it might be construed that his concern was for commercial-versus-private users and that he is silent on the subject on license-free radio amateurs. Amateur of course meaning one who makes no money from their hobby--as opposed to someone who makes a single dollar (pound, kopek, whatever) and is commercial.

I'm not a lawyer and I certainly wouldn't speak for the author, but I see no problem (morale, ethical, or legal) with a license-free non-commercial radio user using his program. This is what happens when someone thinks they know how to write and chooses not to hire a barrister. "Ooops."

Yes, as I understand it the 16 bit version is not limited to hams but the 32 bit version is. I must note that this is a one off flight, my last one, and will only be airborne for 3 hours. I am a tinkerer at heart, and am in no way making any money on this experiment. I hope I am not offending anyone.

Phil

2732. recording a sound file of an APRS signal and replaying it to decode

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-02 13:58:07 UTC
From: Phil
Topic: 2732 Message: 2732

Has anyone tried to record an APRS signal via sound card, and re play it, and successfully decode it once replayed through PC speakers?

If so, and if it works, I'm looking for a .wav sample that I can play with to test the functionality of the 16 bit version of UI View and AGWpe. Any takers?

Regards,
Phil

For practical purposes, the 16 bit version can be used without a
registration. I haven't spoken to Roger G4IDE, so I cannot know what his
idea was. I see that one way of seeing it has been posted on the UI-View
list (where I am one of the moderators) today.
IMHO, if you use UI-View 16 and it works for you, I think nobody will
have any bad feelings about that.

See my other post.
Anyway, the registrars (including myself) do not issue registrations for
anyone not holding a valid amateur license. UI-View32 won't run without
a registration (well, unless it's cracked, and I'm sure some cracked
verions are around); UI-View16 will.

2735. Not showing up in findu

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-06 13:42:28 UTC
From: Joseph
Topic: 2735 Message: 2735

I've lost a nice handful of brain cells and hair this morning on this one.

Car using TinyTracker, sending mic-e data, received by home system (kc2yu-1, 100 ft away) using UI-View32.

UI-Views32 running APRSServer. Confirmed that car (kc2yu-9) data is being igated to Inet.

But, I'm not showing up on findu.

If UI-VIEW is actually passing the data to the Inet, as it's own log shows, what else could be wrong that would prevent it from hitting the findu database?

Thanks very much,

Joseph R. Skoler, kc2yu

Odd even more that it worked yesterday, but not today. What has changed, other than the location of your car? Odd that there is no gating to findu once you got within 15 or 20 (no scale on findu maps!) miles of home. Is it coincidence there are no other mobiles around your home?

The car system worked yesterday while about 15 miles from home, and
was picked up by a different digi/igate.

I believe the car system is working fine.

No coincidence -- it's an APRS vastly underserved area. Hence the
need for my home station igate (eventually with digi capabilities).

But I can't seem to get it to show up on findu (neither location now
raw traffic).

Joseph,

Could it be because you don't have a validated server connection? You are showing up as having a path of TCPXX which means that you have not entered the validation number in the server set-up. I don't think that you can send data without having a verified connection. I think that is true both from UI-View and from the servers, I think that they will reject any data from a non-verified user but I may be wrong on that.

Which server are you connected to?

That was exactly the problem.

I didn't see the validation code in the UI-VIEW registration email.

Thanks!

In UI-VIEW, in the APRS Server settings, a validation code is
necessary to exchange traffic with the APRS servers and database.

2743. APRS, Bulletin, I guess? Question?

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-06 19:26:34 UTC
From: Joe
Topic: 2743 Message: 2743

The description of this group starts out; "Just about every ham has a two meter rig of some sort". The problem is, many are simply tuned to their local repeater, and not 146.52 or other simplex frequencies.

If I wanted to operate simplex, would it be improper to put out a bulletin on the APRS network with a simplex frequency and location? I don't see a lot of message traffic on APRS, much less, bulletins or announcements.

Something like ☐ "Looking for FM simplex contact, 146.55 MHz,
Gambrills Sate Park Frederick MD"

Just curious if anyone has a comment on this, I figured I'd ask around before actually doing it!

Thanks,
73
Joe

I don’t' think that there would be any problem with that. I use the status line in my D7 as "listening 146.520" and have it set up for both channels when I am at an event case someone needs to get a hold of me. Have not had any complaints so far.

2752. New Group APRS-NYC

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-13 19:35:32 UTC
From: Joseph
Topic: 2752 Message: 2752

Hello,

I am extending this invitation to join a new Yahoo group dedicated to APRS users in the NYC Metro area.

Here is the official group's description:

"This group will facilitate communication among Ham using APRS in the NYC Metro area (NYC and surrounding counties, NNJ).

Our goal is that this group will serve as a central point of contact for local APRS users to plan and coordinate, so that we can create a more effective (and fun) network.

Owners of digi's, repeaters, Igates and other structural components of the network are encouraged to discuss and coordinate their use, placement and configuration.

Users (home/base stations, mobile, portable) are encouraged to discuss best practices, coverage, needs, etc."

If you operate APRS, either as a user, station owner or network object owner (digi, repeater, igate, etc.), in the NYC/LI/NNJ/Westchester area, please come to the following address to join:

http://groups.yahoo.com/group/aprs-nyc

Thank you,

Joseph R. Skoler, kc2yu
joseph@...

I wish you best of luck with the new group. I have started a similar group for East Tennessee (EastTNAPRS). We now have 34 people in our group and it contiues to grow. Along with this, we have a voice net weekly to discuss APRS and upcomming events. APRS activity in the area has risen as a result of this group and we are somewhat coordinated in our efforts.

2755. APRS Software Programming Help!!!

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-17 00:06:28 UTC
From: Ken Hanks
Topic: 2755 Message: 2755

I found some time ago, a application which allows you to download Terraserver maps (aerial and topo). The application is USAPhotoMap by Doug Cox at www.jdmcox.com. This application also links with a GPS to upload/dowload waypoints and trackpoints.

I asked Doug if he could incorporate the ability to view APRS data on the map overlay. What he was able to do, was link his application to FINDU.COM and stations burped in the last 30 minutes are displayed.

The delema is that he needs assistance in decoding TNC packets to have the stations overlayed on the map. He has done the application programming in C++. Anyone up to the challenge or can render assitance to Doug?

73,
Ken, W7GMC

Ken, Doug Cox here:
Actually, there's no dilemma. It's easy to decode TNC packets and to have the stations overlayed on the map. But first I need verification by a ham radio operator (like you) that the APRS comm routine in USAPhotoMaps is working okay. You can affirm this by telling me here (or by email (my email address is in my program)) that a file named APRSBuffer.txt (with the raw APRS data in it) has been written to the USAPhotoMaps folder.

2759. APRS Digi

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-19 18:09:24 UTC
From: kr4xn
Topic: 960 Message: 2759

Our small group of local APRS users would like to put up a stand alone digi using just a TNC and radio. We have three to sometimes five users in the local area and have access to an antenna located on a water tank. This would give us much better coverage than the ground level digi one of our locals provides. We presently have an MFJ-1270 and a 2M xcvr available for this project. Would like some suggestions and directions as to setup of the TNC also wonder if there is a firmware upgrade that would allow use of this TNC as a proper APRS repeater. We will upgrade the equipment to possibly a KPC-3+ in the future but would like to get the "home" digi on the air now.

Thanks much, Richard KR4XN

2760. Re: [APRS] APRS Digi

Why don't you ask a local ham club that has some APRS experimenters or get a list of APRS enthusiasts in your area and ask for donations for a KPC3+ and perhaps a modern 2m FM radio donated.

I don't live in your area but operate a Digi (MRIDGE) and (KA0MR-10 Igate) in Central Kansas and although I was in a financial position to aquire the equipment without resorting to asking I would not hesitate to do so and anyone that is an APRS user in your area should be ready and willing to assist in this way. It would only take about 20 generous and concietious operators to accomplish this. Anyone using APRS in an area served by a system that has been put up by anyone as a Digi for hams to benefit from it's placement should be honored to be asked for some financial help.

I realize that but unless the Digi is capable of UIDIGI,TRACE etc paradigm the digi would be inadequate. Realizing the use of the MFJ TNC for the interim with the mention of hopes to get a KPC3+ I thought why not just try for the KPC3+ route and avoid the delay of what could become a very useful site. Certainly no insult was intended to anyone and none taken but that is where I was going with it.

If you're only using it as a digi and not an igate I would stay with the MFJ-1270. I would replace the EPROM with a UIDIGI setup. You can google for it or check out the link below.

http://www.ir3ip.net/iw3fqg/uidigi-e.htm

With UIDIGI you'll get all the benifits of the much higher costing KPC3+ with specialized programming just for your location. You'll have to find somebody that has an EPROM burner but you can write all the settings to a .bin file using a Windoz PC. Then all you have to do is burn the file to an EPROM. Nicest thing (to me) about UIDIGI is unless your EPROM takes a lightning hit and losses it's settings it will always come up with the correct settings after a power blup.

You can even setup UIDIGI to except data from a weather station. The only thing you can't do is use it as an IGATE.

Gene,

I prefer UI-View. You can do a search for it and down load the software. You must register it, but that is free.

2774. could someone forward a recording of an APRS signal to me?

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-24 11:42:01 UTC
From: Phil
Topic: 2774 Message: 2774

Hi All,

I have been working with AGWpe (a sound card based TNC) and need to test it. I don't have the hardware to generate an APRS transmission yet. If you could be so kind, could someone record an APRS burst and send it either to me directly or onto the files section of this forum?

Any format will do. wav, mp3 etc.. I'd like to replay it through the sound card and see if it decodes OK.

Thanks! Phil.

Phil,

Do you have a VHF scanner? if so set it to listen to
144.390 mHz for a little while and you will hear the
APRS packet burst.If not then maybe some one will send
the wav file.

73,
Jim

Hi Jim,

Phil is in Australia, and according to one website I looked
at, 145.175 is the primary APRS freq there. You would have to
remember his earlier posts to know where he is. Other than that
the scanner should work.

I don't know about UI-View and show igate.. but assuming that is correct, what he WON'T know if whether or not HIS igate was the ONLY igate to handle that traffic. This would seem to be required to answer his question of "how useful my Igate is".

2785. Just aquired 50+ Oncore GT+ boards (along with mystery radio's)

Yahoo group: APRS (1998 — 2006)
Date: 2005-08-29 23:14:02 UTC
From: Jason
Topic: 2785 Message: 2785

My company upgraded it's vehicle tracking system and were going to
toss out 50+ tracking units... I saved them from the trash. Yay me!

Along with the Oncore GT+, each tracking unit also contains a stand
alone 3w data radio operating
in the 824-849mhz range. Cellular?
The radio has a 25 pin connector as well as an RJ45.
Radio is a Motorola Model S6889A
FCCID: IHDT5SZ1

If anybody could track down a pinout diagram/schematic for the radio I
will gladly send one to you along with an Oncore GT+ and an SMA->
Panel-mount BNC connector.

I am also looking for an interface kit I can copy or a schematic
diagram or plans I can follow to build my own.

I can post pictures of the radio if anybody needs them to help
identify it.

I bet I know what they are. If they are not units from our company they are more than likely from a Competitor I know. Can you post the pics? I can get full docs on the boards. Any stickers on the side with say a 10 digit #?

I recognize one part - the Motorola module shown in the
bottom pictures is an old style analog cellphone.

Yep. I know em! I can call the engineer who designed it on Wed. and get the info. Basicly the "data radio" is a 3w AMPS (Read Analog AKA "Bag phone") radio. It is used for both data and voice. You need a Motorola handset or programmer to get into it and reprogram.

The units are used like a 1st gen "Onstar" for truckers. "Not only can we talk to the driver about where he is but we can see if he is "LYING ABOUT IT!"

The new company (They have gone through 3 names) uses our units and network now. I have seen lots of these out on eBay and such. The best part is the GPS. Everything else is landfill clog.

Can I have one just for old times sake? Write me off list and we can arrange a trade.

From: KC2MMi
Topic: 2785 Message: 2791

Hi Jason, we digest readers get the list a bit late in the day.<G>

The "ESN" on the unit, the 3W rating, and the frequency all confirm it is analog cellular. At that time, analog cellular was the only "national" way to go. Companies are throwing them out because the cost of analog cellular contracts has always been high (still effectively a dollar a minute including the long distance charges, only slightly less for corporate contracts) and at that price, it quickly pays to spend a thousand dollars and replace it with a new GSM-based system where data can go at a flat monthly rate.

I wouldn't say they are useless. Not worth much--but analog cellular is still arguably the best "mayday" radio for a car. The sheer power (3W instead of 0.6W) means they still "capture the tower" and bump off some other guy with a newer low power phone if there's any competition for a busy tower--like in an emergency. And 911 service is free, no contract needed, with analog still supported on all towers. Best coverage. And since it is usually bolted in--it will be there when or if it is needed.

The old analog bag phones are the only product available with 3W power. Motorola told me that they once made TDMA phones for mobile use with 3W power "but they were too close to an Army frequency and the Army asked us to stop making them". So they told me, anyway.

So...who knows, maybe there's a small eBay market for the phone modules. In some areas, analog is still supported and folks have a hard time replacing them.

2792. Re: [APRS] Google maps Lat/Long entry

Yahoo group: APRS (1998 — 2006)

From: Roger Banks
Topic: 2782 Message: 2792

It's a little tricky to get Google Maps to show you the lat/lon. After you find a map you like, clear the search field and move the map a little with the cursor, then hit the "Link to this page" link. You should get a URL in the browser bar that looks like:

http://maps.google.com/maps?ll=32.711492,-117.188319&spn=0.007650,0.009130&t=k&hl=en

Then you can mess with 'll=' fields to your hearts content. If there is a 'q=' field in your URL you can just delete it if you want.

K1LCH just forwared me the posting about "funny paths". Included was a comment about my HF beacon. I realize this doesn't "do" anything on HF, BUT.... I am using a KAM+ with port 1 on 2 Meters amd port 2 on 30 Meters. I looked and looked and can't find any sort of suggestions for this application (using UI-View). I reason that on HF even without "ECHO" I would be seen over a good part of the USA. Must be working, he saw it.

Any suggestions for a path on a two port TNC??

I have one better than that. Last fall I was driving to work about 6am CST (I live in Kansas) and on my D700 a German callsign appeared and I checked it on the D700 (144.39) for location and it for certain was there some 5000 miles east. When I got to work I looked up the call on Findu.com and that callsign was in fact a regular APRS station in Stutggart Germany. I e-mailed the guy but he never bothered to answer but after I pondered it I realized what I must have seen was a meateor that probably came in over the Atlantic and I got his burst at the perfect time as no other strange call appeared at that moment.

From: jay_kruckenberg
Topic: 2795 Message: 2795

I am getting started in APRs and have been told to setup my UNPROTO ADDRESS as APRS,WIDE3-3. What does the APRS in the unptoro address do? When I remove this from mt Kenwood TH-D7 it shows up through our local digipeater. With it in it usually doesn't show up. I was just wondering if you need it? what should my UNPROTO ADDRESS have in it?

If you are using UI-View32 as your APRS program on your PC, you need to start the unproto path with APRS in the UI-View32 setup.

In the Kenwood radios and most other APRS programs you do not want the APRS at the beginning of the path, it gets inserted in there by the program.

2797. RE: [APRS] Funny path

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-01 04:42:38 UTC
From: N0YXV - Stan Coleman
Topic: 2793 Message: 2797

Ok I know email isn't a perfect mode of communications and it's easy to miss understand, so help me out here. It sounds like your happy that people can see your signal all over the US? If that's so I hate to be the spoiler of your fun but that's bad news not good. In APRS land the object isn't to see how far away you can be heard. Although that works in standard packet communications all it does in APRS Land is flood an already full 1200 baud band. In Packet Land everybody has paths and sends packets directly to another point via DIGI's. In APRS Land everybody sends there packets to everybody via a DIGI (and directly). So it's like the difference between a garden hose (packet) and a fire hose (APRS). If you try to add another garden hose to the fire hose you probably are doing it at expense of crushing somebody else's packet.

I hope I read your email wrong and your not happy about sending your packets clear across the US. On VHF you won't need much of a path try WIDE2-2 or smaller maybe even WIDE1-1.

My guess would be that the person who told you that is a UIView user. The APRS is a generic "destination" address and under most circumstances should not be part of the UNPROTO address. In the Kenwood, the UNPROTOCOL should be set to something like APKxxx (where xxx is a number, on my D700, it is 101) indicating that it is a Kenwood radio. The PACKET PATH would be where you enter the WIDE3-3.

If I understand it all correctly. If not, I'm sure someone will correct me.

That would work if it's a home station. For a mobile it would work anytime your near aa4qi-1. As soon as you leave the aa4qi-1 range everything (from a digi standpoint) would stop. Igates would probably still receive it and add it to APRS-IS but wouldn't digi it.

For mobiles use wide1-1,wide2-2 in rural areas and wide1-1,wide2-1 in urban areas.

A setting that would work with any home station within 3 digi hops of an Igate is wide2-2.

From: Grover Cleveland
Topic: 2802 Message: 2802

My APRS Digi K6FGA-1 shows up just fine on Findu and is working properly as a digi. The stations that are appearing in the region are using it as can be seen in raw data. For some reason the digis appearance on UI-View is spotty.

Surely it's something in the config, yes?

Grover K7TP

2803. What's this all mean

Yahoo group: APRS (1998 — 2006)

From: jay_kruckenberg
Topic: 2803 Message: 2803

I am new to APRS and am trying to figure this stuff out. We have a digi that is running UI-View as a digipeater here in northwest Oklahoma. It seems to hear a lot of stations but doesn't seem to pass much on. Below are a some lines from the terminal screen of a couple of stations that didn't get digipeated on. I would like to know what all this means and how I can tell if and why this station didn't get digipeated on. I don't know if our digi is working OK or not.

```
5:52:48R GRND>APN382,TSARG-2*,WIDE3 Port=1 <UI Len=65>:
!3642.45NS10352.54W#PHG5830/W4,NMn/N5DIG-15 Digi
```

```
18:59:07R WA5ETK-7>APN382,TSARG-2*,WIDE3 Port=1 <UI Len=66>:
!3550.60NN10126.78W#PHG7560/A=003642/*PCG* APRS DIGI STINNETT,TX.
```

Any help would be much appreciated. Eventually I'll get this all figured out. I hope.

2804. APRS vs NO APRS? How does this thing work exactly?

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-10 00:27:04 UTC
From: govna1986
Topic: 2804 Message: 2804

I am VERY VERY new to APRS and I'm trying to discern if using APRS for my system design is appropriate. Essentially, I'd like to use my GPS module, mobile TNC, and two-way radio to transmit my GPS location no farther than 2 miles away to my laptop and continually update this information periodically (every 10 seconds or so). My problem is three fold:

1) To date, what I have read about how APRS is used suggests that an internet connection is needed to attain the transmitted GPS information. I have, however, been told that there is software which can use my PC's sound card to accomplish this same task without the internet. I'd like the capability to take an isolated system out to an open field, lets say, and leave my laptop stationary while I move about, 1 to 2 miles away with my mobile equipment (radio, tnc, gps) transmitting my GPS location. Can I make use of the APRS software to accomplish this and if so, how, without the use of the internet, wireless or otherwise?

2) I've been refering to the following link for APRS downloads and I'm fully confused as to which file is appropriate for my needs. Is there any direction on how I should decide which file(s) are best for what I'm trying to accomplish?

ftp://ftp.tapr.org/aprssig/dosstuff/APRSdos/

3) Finally, I'd like this system I'm building to be very responsive (as I mentioned previously, I'd like to refresh my GPS location every 5 to 20 seconds). From what I've read to date, it doesn't appear that APRS would be best suited for this type of quick information reporting. Am I wrong? I'd also like the RX side of my system to have the capability of sending a request for my current GPS location irrespective of the pre-defined transmission interval.

Anyone with some insight into my problem(s)/ queries, I'd truly appreciate it.
Thank you.

[Stan Coleman]
An Internet connection isn't needed, that is if you want to use two radios. The only way you'd need any internet connection is if you can't get RF access to the other Radio/TNC. Assuming that you have two Radios and two TNC's you could easily transmit your GPS data over short distances (within the range of your radios) to your laptop. In other words the GPS is connected to TNC #1 in your car. Then TNC #1 is connected to Radio #1 in your car. Your laptop would be connected to TNC #2 which is then connected to Radio #2. Now if you only have one Radio and TNC and you happen to have people in your area doing APRS you would only need one Radio/TNC/GPS in your car. (See warning note below)

As far as the sound card idea goes the sound card is only a replacement for a TNC. If you don't have or can't afford to buy a TNC you can do Packet (APRS) with a sound card connected to your radio.

[Stan Coleman]
WARNING
If you want to transmit every 20 seconds or so on the public APRS network I'm sure you'd meet up with some strong negative reactions to doing so. APRS is only 1200 baud and at 20 second intervals you might simply plug up the RF network to the point nothing would work.

As far as a stand alone system goes on Amateur Radio I'll defer to the other experts watching this forum. There are a bunch of legalities when trying to transmit data on other than approved frequencies. I'm assuming from your post that you're considering using a different frequency than 144.39 with is the national APRS frequency.

I would be curious as to why you'd want to transmit so often? There are such things as "Smart Trackers" which can transmit more often if there is a major change in direction.

2807. Davis Vantage Pro2 with UI-View/32 on WinXP

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-12 00:43:34 UTC
From: kz1x
Topic: 2807 Message: 2807

Hi

I am setting up a Davis Vantage Pro 2 weather station in an elementary school classroom.

I have the Davis accessory that reads the station information and feeds it into a PC.

I want to see if I can use UI-View as both the local APRS client AND ALSO use the weather station's data, sent over the air in my APRS beacons, at the same time.

I am not interested in using the PC (at this time) with the Davis logging program, nor do I care much about a PC UI for the Davis. Their supplied console is plenty of information for these kids (5th graders).

I know I can do this easily with WinAPRS.

I do not see how it gets done using UI-View.

Anybody else ever do this with UI-View?

Should I use WinAPRS, since I know how that works?

tnx

Steve KZ1X/4

Steve,

If you use the Davis Software with the Data Logger, you can automatically send your WX info via the Internet as a APRS packet.
You can see my WX Station at
http://bellsouthpwp.net/l/a/labord_k/weather/Current_Vantage_Pro.htm
I am running the original Vantage Pro Wireless for many years now with no problems, and no interference from my Ham Equipment running Legal Limit.
I hope this information can help you. I am not familiar with the UN-View Software so can't help you there.

Keith, K4KAL

Yes, but you need another program to feed the davis info to uiview. I use weather-display. It can be found at www.weather-display.com <http://www.weather-disply.com/> .

2810. GPWPL command

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-12 03:25:06 UTC
From: bino_oetomo
Topic: 2810 Message: 2810

Hi All

Actualy , I need to build a system (hardware) that will enable user to receive "target" location via a wireless (VHF) communication.
It's still at the early stage (RnD).

I Have a GPS-III+ on hand , with firmware 2.06

I set the GPS unit interface to NMEA, an plug it to PC .. Open a HyperTerminal session.
The hyperterminal windows receiving all NMEA input from the GPS output.

I Try to send a command of :
$GPWPL,4807.038,N,01131.000,E,WPTNME*31
As stated at : http://www.gpsinformation.org/dale/interface.htm , but it
didn't work.
There is no new waypoint record at in the unit.

Is it just because i use Old GPS-III+ ?
Is there any known Garmin product that can handle NMEA $GPWPL input-command ?

Sincerely
-bino-

Are you sending line feeds with the string?

I have a small Windows program I wrote that will generate a $GPWPL string and send it to an NMEA capable unit. I used a III+ for my testing. Yours should be fine.

You can download the program for free at: http://www.ke4nyv.com/software.htm Under the name Waypoint Generator.

Topic: 2815 Message: 2815

I am getting ready to setup my kpc3 8.3 for APRS. It will be primarily a standalone station, using UI-VIEW. However, every once in a while my PC crashes and I want the KPC3 to continue to beacon. Occasionally, I will be required to operate as a fill-in digi. So my question is how do I setup the TNC properly for the new paradigm and be able to cover my basis?

Fran (N1GAU)

It Work !!.

Do you make this application to send double LF in the end ?
My friend send me a small program (Bot GPS Specific) . He let me to
add any additional CR and LF at the end of sentence .. but still
didn't work.

I send a CR and LF at the end. When you click "Make String" you'll see these two characters at the end of the string that is sent via the serial port.

2820. Sending messages from the keyboard.

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-15 02:41:13 UTC
From: Bruce & Leigh Coates
Topic: 2820 Message: 2820

Hi

I'm under a deadline to get an APRS presentation ready for the weekend and don't have time to look through the archives and such. If I have the time, I'd do the research myself.

A fellow ham has asked whether he can send an APRS message using just a plain TNC-2 and simple terminal program such as HyperTerminal.

I'll be operating a station at a search and rescue command center under VE5BNC. The other ham will be operating a portable station with a TNC-2 and a laptop running a terminal program under the call VE5RY-??. His home station will be setup up for digipeating under the call of VE5RY.

The question is, "What exactly would he type into his terminal program so that it creates and sends an APRS message to me either direct or via the digipeater?"

Thanks in advance.

Bruce - VE5BNC

Someone maybe able to correct me if I'm wrong. But, if you want he full capability of APRS, he'll need to run UI-View32 and possibly AGW Packet engine to help convert the APRS sentence so the TNC-2 read it.

A TNC-2 by itself (unless it has an updated ROM) can't handle APRS sentences. You can send messages to a station in UI-View32, but I don't think Hyperterminal can handle aprs sentences.

AGW Packet: http://www.elcom.gr/sv2agw/agwpe.zip

UI-View32: http://www.apritch.myby.co.uk/uiv32.htm

Hi Ken

Actually, a typical TNC like a TNC-2 compatible will work with almost any APRS client regardless of the ROM version. Even though KISS mode is recommended, they can still be used without switching to KISS if you TNC doesn't support it. It think the only exception might be some of the programs like OziAPRS and AGW Tracker which are designed to work with third party utilities like AGW Packet Engine.

The updated ROM's simply add APRS specific capabilities such as stand-alone APRS tracker, smart digipeating, etc. The specific features in the updated ROM's vary from manufacturer to manufacturer.

The following link to one of Bob APRS Bruninga's web pages tells how to do it. It was written with the ISS in mind but it should work for you if you substitute your digi call or alias for ARISS in the unproto path.

<http://web.usna.navy.mil/~bruninga/iss-aprs/issicons.html>

It is probably faster and easier to install and configure UI-View.

2824. UNPROTO PATH

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-19 21:02:16 UTC
From: Trm Martens
Topic: 2824 Message: 2824

Hi All, I am trying to set up my THD7a (g) to contact the ISS. I found the following written by Bob Bruninga:

ISS/APRS Satellite Frequently Asked Questions
Bob Bruninga, WB4APR, US Naval Academy Satellite Lab, Annapolis, MD

WHAT PATH DO I USE? . Recently the ISS is now using the ARISS alias path. Since PCsat also supports the generic path of ARISS (when it is properly configured), this means you can operate either ISS or PCsat without reconfiguring your TNC! Just set your UNPROTO path to APRS VIA ARISS and it should work with both birds.

Mu question is ; Where do I set the UNPROTO path, is that in menu item 2-E UNPROTOCOL or is it menu item 2-B PACKET PATH?

Dear All.

I appologize for this OOT Post.

Kindly please give me recommendation for best (Price vs Performance)
radio that :

1. Available at the market.
2. Easyly modified to 9600 baud capable.
3. 30 - 50 watt at VHF/UHF.

I read the TAPR website about modification some radio, but looked like
it's for old radio that no available at the market anymore.

thanksyou for your support.

Sincerely
-bino-

Hello Warren:

First, thanks very much for the reply.

Now that you mention it, I remember seeing a splash
atop the opening screen about the FindU service (server)
moving, but didn't realize that it was happening in the
current time frame. (Maybe I ought to pay closer
attention to these messages!)

Again, thanks for confirming that FindU isn't being
filtered by my ISP.

Actually the backup server is running but it simply can't handle the load by itself so most request are getting ignored. We should see the whole system coming back online by Saturday sometime. If you don't need it PLEASE don't use it.

2839. MAPS

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-27 11:37:51 UTC
From: Henk Oegema
Topic: 2839 Message: 2839

Finally, after a long struggle(as a complete Linux beginner!!), I
got Xastir working in SuSe9.3.

I can see stations popping up on my screen.(via internet)

I have a minimum Xastir install.

However I need some assistance on how to get a map.
At the moment I have a grey background with map grids. That's all.

I have read README.MAPS, but it's confusing me all that information.

What I can see in /usr/local/share/xastir/maps are two directories:
GPS and Online.
In Online there are some files like xxxxx.geo.

I suppose these are the maps.
But I'm not able to load them.

Please give me some simple steps how to do it.
(I also need a map for the Benelux, to see my own region)

Thanks
Henk Oegema

2840. KP3+ Power Supply

Yahoo group: APRS (1998 — 2006)
Date: 2005-09-28 01:22:38 UTC
From: ochf13
Topic: 2840 Message: 2840

Hello All,

I would see if anyone know if power supply and plug from radio shack. If you know the part numbers use with KCP3+.

Thanks,
Chris Colquhoun

Sent in my donation today.

Thanks for pointing out the page to use paypal.

Supply voltage should be 12V + center pin.
Radio Shack carries an entire line of adapter ends.
Take the unit to the store and they should have no
problem finding the correct end for it.

The KPC3+ needs a voltage between 6 and 25 VDC @ 30ma with the center pin +. I think it is a 5.5mm od, 2.1mm id plug. I'm sure Radioshack could fix you up with something if you bring your TNC along. It's not really critical as long as it is DC, center pin +, and between 6 and 25 VDC. The KPC3+ has an internal voltage regulator. I run my KPC3 (not+) off the same 12V supply that powers the radios.

2844. HamHUD II Revision E Pre-Order

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-02 23:40:39 UTC
From: J. Rausch
Topic: 2844 Message: 2844

The HamHUD Group has revised the HamHUD project and we're getting ready to take kit orders.

Here is a rundown of the current project:

1. The NEW PCB contains ALL of the parts including the user interface components.
2. The current design still requires a Kantronics KPC3, KPC3+ or any TNC-2 clone. MFJ and AEA TNC's have been sucessfully tested for 100% operation. The future hope is to add KISS support. THERE IS NO TIMEFRAME ON THE KISS IMPLEMENTATION AT THIS TIME! Please keep that in mind.
3. There has been a vast improvement to the hardware interface. The single pin header has been replaced with a single DB15 connector that can be mounted one of three ways to the board: On the back sticking out, along the bottom edge of the board to stick straight down or on the right side edge to stick out the right side end on the unit. Along with the connector, several output/input options have been added such as a +12VDC and +5VDC out for powering external GPS units. There is also a ground pin for every signal pin, no more splitting up a single ground for multiple hardware devices.
4. The new PCB has been sized to slide right into a custom 130mm extruded Hammond case. The standard case is 120mm, we have worked out a deal with Hammond to have these special 130mm cases made for this project. The cases will be pre-milled with all required holes for UI, LCD, LEDs and connectors. The cases are anodized black.

All other past functions of the original and second generation HamHUD IIs are still part of this version.

Please visit http://www.hamhud.net/hh2 for full details of the HamHUD II's functions. You can also download the user manual from that site.

The current construction manual can be found at http://www.pinzi.us/Scratch/HH2RevE_Draft.pdf This manual will change as we revise it. Version 1.0 of the manual will be posted soon.

As we have to order soon to have HamHUD2-RevE ready for Xmas (pcb can take up to 7 weeks to get a good price) we will need a list of those who want to buy one. The price depends on the quantity we are able to buy as there are some good discounts at larger quantities.

To make kitting easier we will only provide the following options:

PCB only: $10
PCB + case + FRAM: $44/$39/$35
Complete kit $135/$110/$90

$xx/$yy/$zz is price for 25/50/100 kits total purchase. (All prices plus shipping!). As there may be a mix the prices for the last two positions may vary a bit.
Please keep in mind: if you have to order parts the complete kit is most likely much cheaper then ordering small quantities of parts and pay shipping.

If you want to participate in the group buy please email me, Jason at jason@... to be added to the pre-orders list. See http://www.ke4nyv.com/hh2revebuy.htm for further info.

PLEASE! We don't have any commercial stake into this adventure! ONLY email me if you are willing to later pay for whatever you signed up for. Be aware that we may end up with the 25 unit price if there isn't enough interest for more. In case we get "late payments" and the quantity is larger then anticipated the prices will naturally be recalculated and any overpayment will be refunded.

I am personally offering to assemble units for those who would not like to build the kit. I can also assemble custom interface cables for your particular application ie. TNC/GPS/Power. if interested, please email me for a quote to the above email address.

Thanks!
The HamHUD Team

Hi if you would prefer, you can supply power to the
KPC3 via the DB9 or the DB25 connector. This is how I
did it, according to the instructions in the link
below. Don't forget the diode on the battery if you
intend to leave it in the KPC3.

Not our local Radioshack. Those guys wouldn't know which end of a soldering iron is hot. You would think that it might be nice (maybe even a requirement) if they knew a little about the products they sell. Everytime I go in there one of them runs up to ask if he can help me and when I tell him what I'm looking for, I usually get a 'deer-in-the-headlights' look and the stock answer is 'We don't sell that' even when usually I find it on the shelf myself afterwards.

But we're stuck with them as the closest other RS or parts store is about 90 miles away.

I just had to reply to this message. I walked in to on of are 2 local Radio Shack store a few years back and the person came out from behind the counter and asked if they could help. So I asked the person for a 50 pack of small signal diodes. "We don't sell any thing like that" the person was dead serious. So I said ok I'm going to look around I walked back to the shelf pulled 2 packs off the hook and walked up to pay the same person checked me out at the counter. He said ooohhhh you found them. He started to ring them both up and I said I just need the 1 pack. He said well why did you bring 2 packs then I said the other pack is for you find the hook and put it back so the next time some asks for these you know where there at. The person behind the counter did not like that much but I'm sure that them got over it. I agree Radio Shack should give there employees an IQ test before they put them on the pay roll .

So for the long off topic reply but I had to share my radio shack store.

Interesting stories, but I'm sure that you'll find the occaisional RS employee who knows his stuff. It's just that you can't expect that much from someone you pay a 6% commision or $6/hr (I'm guessing), whichever is greater. You will find every so often a knowledgable person who is working a second job (mainly to get the 10% employee discount), like I did about 12 years back.

People would come into the store, ask about some electronics question, and I would grab a sheet of paper and draw up a few schematics for them to try out - then help them find the parts to do it. Of course, not every RS employee is going to have an EE degree.

And at 6% commission they're not really concerned about the <$2 parts in the back of the store, they want to sell TVs and stereos and computers in order to beef up their income.

If you are so worried about finding good help at your local RS store, why don't you apply?

From: N0YXV - Stan Coleman
Topic: 2840 Message: 2849

Ditto...I used to work at a Radio Shack. Although I tried to work it for cash I mostly just wound up with the 10% (or so) discount. Normally when you have employees that work on commission they are MORE than willing to help you. In Radio Shacks case parts simply don't put steak on anybody's table. Several of the people I worked with really did know the answer to questions but it wasn't worth their time to sell you a product they could make 10 cents off. If they are working with you helping you find the diodes then the big TV or VCR sale might go to another associate. Now I was the exception because I believed that if I helped you with your 10 cent purchase you might come back and ask for me when you were ready to buy the TV. A lot of the time it worked, while at other times customers simply forgot that we worked off of commission. Ya sure Radio Shack pays by the hour but that's only if you don't have enough sales to make it off of commissions. What Radio Shack pays per hour is so bad that it make the hourly wages of waitresses look like a million dollars. Until Radio Shack comes up with a better way to pay employees you will never get good service. It's also the reason why you meet so many people that are X Radio Shack Employees. How they treat their managers is even worse than how they treat their sales associates. Somebody needs to let Radio Shack know that if they really want the TOP more qualified associates they are going to have to PAY the TOP prices to get them. When you pay the bottom of the barrel prices you get the bottom of the barrel.

Although I found all the postings to be very funny and all too true here is my suggestion. If you're going into Radio Shack all the time find the associates that knows the most about what your looking for and try to always deal with that person (or maybe persons). Obviously not everybody knows everything about everything [well maybe I do :-)]. If you build up a report with that person and they know that you are willing to buy not only diodes but TV's from them then they will always treat you like royalty. That is unless they're not smart enough to see a good thing when they've got it and then I'd just move onto another associate.

Although Radio Shack does train it's employees it doesn't train them about diodes. They train them how to sell the TV's and VCR type objects. One of the worst things Radio Shack ever did was to come up with the slogan "You've got questions...we've got answers". When they said that they mean, "We have the answers on how to sell you large money making items" not "We have the answers to everything."

P.S. I wouldn't count on anybody helping with diodes during the Christmas rush season. That's the only time of the year that an associate can actually make some money.

As a Radio Shack customer since they had their earlier name (does anyone recall it?) I can say that the quality of their customer service on small items is very "store manager dependent." Our local store appears to attract managers who do try to help the small item customer. I try to get to know the manager and show him that I appreciate his attention.

But, yes, the headquarters folks are always struggling to show better results to Wall Street and selling small parts to hams doesn't do that for them in that area.

Subject: RE: [APRS] Re: KP3+ Power Supply

Ditto...I used to work at a Radio Shack. Although I tried to work it for cash I mostly just wound up with the 10% (or so) discount. Normally when you have employees that work on commission they are MORE than willing to help you. In Radio Shacks case parts simply don't put steak on anybody's table. Several of the people I worked with really did know the answer to questions but it wasn't worth their time to sell you a product they could make 10 cents off. If they are working with you helping you find the diodes then the big TV or VCR sale might go to another associate. Now I was the exception because I believed that if I helped you with your 10 cent purchase you might come back and ask for me when you were ready to buy the TV. A lot of the time it worked, while at other times customers simply forgot that we worked off of commission. Ya sure Radio Shack pays by the hour but that's only if you don't have enough sales to make it off of commissions. What Radio Shack pays per hour is so bad that it make the hourly wages of waitresses look like a million dollars. Until Radio Shack comes up with a better way to pay employees you will never get good service. It's also the reason why you meet so many people that are X Radio Shack Employees. How they treat their managers is even worse than how they treat their sales associates. Somebody needs to let Radio Shack know that if they really want the TOP more qualified associates they are going to have to PAY the TOP prices to get them. When you pay the bottom of the barrel prices you get the bottom of the barrel.

Although I found all the postings to be very funny and all too true here is my suggestion. If you're going into Radio Shack all the time find the associates that knows the most about what your looking for and try to always deal with that person (or maybe persons). Obviously not everybody knows everything about everything [well maybe I do :-)]. If you build up a report with that person and they know that you are willing to buy not only diodes but TV's from them then they will always treat you like royalty. That is unless they're not smart enough to see a good thing when they've got it and then I'd just move onto another associate.

Although Radio Shack does train it's employees it doesn't train them about diodes. They train them how to sell the TV's and VCR type objects. One of the worst things Radio Shack ever did was to come up with the slogan "You've got questions...we've got answers". When they said that they mean, "We have the answers on how to sell you large money making items" not "We have the answers to everything."

P.S. I wouldn't count on anybody helping with diodes during the Christmas rush season. That's the only time of the year that an associate can actually make some money.

2851. Too Many WX Stations?

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-04 12:51:54 UTC
From: w3ce_qrp
Topic: 2851 Message: 2851

I've found, via UIVIEW connected to an INET APRS server, that there are quite a few areas where multiple weather (WX) aprs stations are in close proxcimity. One spot in the US has 4 stations withen 2 miles of each other and they are sending their weather beacons at the rate of one every 2 to 5 minutes.
Do we really need that many WXs that close together? The weather does not change that quickly, beacons every 2 minutes seems excessive. That many beacons tend to clog up the frequency.

My 2 cents worth

I can see your point. But here in Florida where it could raining on one side of the street and sunny on the other most of the weather stations are linked up with NOAA weather and feeding them information for there reports. The more weather stations there are the acurate the reports will be.

Take a close look at the path these Wx stations are using. A very large portion of them are Citizens Weather stations (CW#####) going in via internet only (TCPXX) which means they aren't clogging up anyone's frequency.

I have felt for a long time that those WX stations you see on FINDU etc that are obviously connected via internet only and are not licensed hams have no buisness showing up on the screen anyhow. Maybe I am wrong but I thought APRS was pretty much a ham radio endeavour? Am I in lala-land on this!!

And yes there are way too many and I think it is because of the inetrnet wx stations only. Farnkly with the advent of technology and wx info at your internet fingerstips i wonder if ham wx stations are really of much use today and the energy could be use for something more useful.

I just had to reply to this message. I walked in to on of are 2 local Radio Shack store a few years back and the person came out from behind the counter and asked if they could help. So I asked the person for a 50 pack of small signal diodes. "We don't sell any thing like that" the person was dead serious. So I said ok I'm going to look around I walked back to the shelf pulled 2 packs off the hook and walked up to pay the same person checked me out at the counter. He said ooohhhh you found them. He started to ring them both up and I said I just need the 1 pack. He said well why did you bring 2 packs then I said the other pack is for you find the hook and put it back so the next time some asks for these you know where there at. The person behind the counter did not like that much but I'm sure that them got over it. I agree Radio Shack should give there employees an IQ test before they put them on the pay roll .

So for the long off topic reply but I had to share my radio shack store.

Not our local Radioshack. Those guys wouldn't know which end of a soldering iron is hot. You would think that it might be nice (maybe even a requirement) if they knew a little about the products they sell. Everytime I go in there one of them runs up to ask if he can help me and when I tell him what I'm looking for, I usually get a 'deer-in-the-headlights' look and the stock answer is 'We don't sell that' even when

usually I find it on the shelf myself afterwards.

But we're stuck with them as the closest other RS or parts store is
about 90 miles away.

2861. Re: [APRS] Too Many WX Stations?

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-05 05:41:46 UTC
From: Steven
Topic: 2851 Message: 2861

The weather stations operated by hams and non-hams (citizen weather stations via internet) provide the National Weather service and the Hurricane Center valuable information. Data is highly prized and sought after. In fact I believe that the WXTrak from Byonics was designed in part due to requests from the weather people. Internet weather info at your finger tips has to get data from somewhere.

Hi, Bill,

Yep, that was it! You have a very good memory!

73,

Ed

Does anyone have a recommendation for a PDa to use with mobile setup?

I have a tinytrack,KPC3, various radios and would like a visual display
at times but do not want to use the laptop.

Thank,

Richard, KR4XN

Topic: 2851 Message: 2865

Sorry but I disagree with that. The NWS does not go to findu.com for information. I interface a bit with the NWS here in Wichita and spent a bit of time during bad wx and they have an unbeleiveable amount of high tech access via their system that they waste not a microbaud of data on weather stations infromation on APRS. The point may well be that many people do use the data and it is useful to those that access it but don't entertain us for moment that the APRS wx system provides a glimmer of what Federal Budgets can purchase and develop. The only complaint I had was so many non-hams using client APRS for their stations. My maps get awful crowded with those BIG blue WX symbol with no ham call associated with it.

2866. RE: [APRS] Too Many WX Stations?

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-05 23:50:49 UTC
From: Ron Cluster
Topic: 2851 Message: 2866

Ah! So it's a personal taste kind of thing.....

So just filter them out so the server doesn't send them to you.....Easy. Go here to learn about the filters:

http://france.aprs2.net/filter_guide.html

BTW.....the creator and keeper of findu says that the weather data is used by NWS, NOAA, Madis and others. I'm inclined to believe him. Just because your local NWS office doesn't do that, doesn't mean it isn't happening.....

And no, APRS is not restricted to hams. Just the RF part of it.....

73.....Ron.....AC7TK.....(-9 Mobile, -2 Wx, -1 at Work)
UI-View32 iGate in Eugene, OR

If you are using UI-View go to "Exclude/Include Lists" and put CW* in the Exclude Callsigns and Object Names window and
then check Enable exclusions.

2868. Re: [APRS] Too Many WX Stations?

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-06 04:56:03 UTC
From: Steven
Topic: 2851 Message: 2868

Well maybe the folks in Wichita should call the folks at the Nation
Hurricane Center or read the WX4NHC website. The NOAA Citizens Weather
Observers Program (http://www.fiu.edu/orgs/w4ehw/CWOP-Main.html) uses the
real time data in weather prediction models that can be seen at
http://www-frd.fsl.noaa.gov/mesonet/

Check out the Amateur Radio Station at the National Hurricane Center website
http://www.wx4nhc.org/

Steven

2869. Re: Too Many WX Stations?

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-06 13:08:16 UTC
From: n9oew
Topic: 2851 Message: 2869

My name is Gerry
My Call sign is N9OEW
My CWOP ID Is AR825

I run a weather station here at my home QTH.

Now let me inform those of you who don't know
the TRUTH about APRS WX stations and NOAA.

Some WX data on Findu.com IS USED BY NOAA.
NOAA uses data collected by the MESONET servers.
The WX data from findu.com is collected by MESONET.

Also, there are some stations who have websites setup
strickly for NOAA's use.

For example,

I have a page that can only be accessed by NOAA in LaCrosse
WI. (KARX)
And that page gets between 20 and 300 hits per month.
--SO I KNOW THEY USE IT---
Most NOAA weather reporting stations only report at scheduled
times, whereas, our stations are real time.

I set up my WX station according to a set of guidelines developed
by NOAA. I also receive regular reports as to the accuracy of my
data.

My 5 minute report interval is according to the CWOP guidelines.

I work very hard to assure the dependability and accuracy of my
data because I know NOAA uses it.

PLEASE, don't knock what you don't know.

73's de N9OEW

2870. RE: [APRS] Too Many WX Stations?

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-06 20:05:55 UTC
From: Bob Bailey
Topic: 2851 Message: 2870

Paint it any color you want to see. Go to your local NWS and see the sophisticated systems they have and picture yourself at the controls. See any APRS on the screens. Yea it's in front of the $600,000 Doppler radar feedback display blocking it because APRS is a more valuable tool.

I probably was on APRS long before you (1991). Bottom line is APRS is basically an RF concieved idea so If these non RFstations want to use it as a client great I just wished they would place themselves in another screen that would not come up under RF APRS. If they want to play APRS get a ham license the more the merrier it just adds to our ranks and I welcome them to it.
Ron Cluster <rcluster@...> wrote:
Ah! So it's a personal taste kind of thing.....

So just filter them out so the server doesn't send them to you.....Easy. Go
here to learn about the filters:

http://france.aprs2.net/filter_guide.html

BTW.....the creator and keeper of findu says that the weather data is used
by NWS, NOAA, Madis and others. I'm inclined to believe him. Just because
your local NWS office doesn't do that, doesn't mean it isn't
happening.....

And no, APRS is not restricted to hams. Just the RF part of it.....

> come up under RF APRS.

Well, that's the crux of it right there. They DON'T come up under RF APRS.
You will only see them if you connect to the APRS-IS.

You can wish all you want but that won't keep them off your screen, setting
a proper filter will.

Well radio-shack as we onces knew is closed,
they have become"China Made retailer" today

they sell tv,vcr,junk little remote control car,,,,all those things are
filling the
dump after some month ,,,,,,,,,,,,

here they call themself "la Source"
the source ,,,,,,of what!!!!!!!!
the other day i ha to explain at the employees what was a diode,,,,,

73/s

ps sorry for the comment,,i had to say it ||||

2875. Use of Google Earth and Google Maps...

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-07 00:38:32 UTC
From: omnidynamic
Topic: 2875 Message: 2875

Donno if anyone is interested or not but I figured I'd post it...
www.openaprs.net has created a pretty slick interface to Google Maps, Google Earth and APRS (& IRLP nodes). It can track "lastest stations" based on city/zip code as well as draw a track of a specific station. Also has weather station data.

If you haven't heard about it, enjoy...

Greg

2876. CW stations

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-07 17:49:24 UTC
From: KC2MMi
Topic: 2876 Message: 2876

Maybe this is a radical proposal, but...

Since many FINDU users have no use for the CW stations,
while SOME small number of users very much need that information,
AND FINDU is overloaded with server-side work in any case

How about changing the FINDU programming (sorry!) and splitting off the CW information entirely from the main program? Process it separately, stream it to a separate machine, keep it segregated and then ONLY serve it up to FINDU customers as an overlay--when and if asked for it.

Otherwise, break the CW information off entirely, and let the "I'm really here because I need CW" folks spin off to another server, so part of the load can be shed at the same time?

I'm not saying that's "the" solution, but perhaps someone more intimate with system requirements could take a look at options like that? Load shedding, to make everyone happy?

2877. HF APRS

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-08 16:52:47 UTC
From: Paul Luggar
Topic: 723 Message: 2877

Hello all, can anybody tell me what is the correct frequency on 20m to use a AEA TNC and an FT847 set to LSB?
I can't decode anything on 20m where I'm allowed to operate, but I can decode loads on 30m where I can't operate (10.151 is out of band in the UK)
Thanks.
Paul.

2878. OT kinda: Voice chip for Kenwood D700A

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-08 17:11:40 UTC
From: Rusty Coleman
Topic: 723 Message: 2878

I have the Kenwood D700A APRS mobile in my car and am interested in how the voice chip for this radio sounds. Google did not reveal any sites with a wav file of the chip speaking. Can someone here with one of the Kenwood radios that takes that chip (VS-3) possibly record an audio of it speaking? I sure would like to hear it before I buy one. Also does it read the APRS messages you get on the D700A?

2884. VCom Voice Navigation System

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-12 03:18:20 UTC
From: wa9afm
Topic: 2884 Message: 2884

I recently pulled a VCom Voice Navigation system from the XYL's car; her new one came with an integrated nav system. There's a RJ-45 connector on the side, but nothing in the instructions indicating what it's for. Does anyone know if there is a way to tap NEMA 0138 signals out of this unit? I was thinking of installing it in my vehicle and utilize it for both navigation and APRS.

2885. HF APRS without Packet! APRS-PSK63 testing is often done on 14.109.5 mhz

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-13 00:17:25 UTC
From: wb6mlc
Topic: 2885 Message: 2885

Hi all,

Actually APRS-PSK63 testing has been going on since last spring on 7.087mhz USB, 14.109.5mhz USB and 3565mhz USB. These are standard HFpack data frequencies that are shared with PC-ALE users, and other members of the HFPack HF portable Group.

A paper on APRS-PSK63 was published in the TAPR/ARRL 24th Digital Conference Compendium , which should be available soon. Members of the APRpack Yahoo Group are using APRS-SCS, UIVIEW and WinAPRS along with PSK63Srv, a modified version of the PSK server written by the late Roger Barker, G4IDE back in 2002. We conduct frequent APRS-PSK63 nets on 7.087mhz USB most weekends around 8:00pm.

If you are interested in learning more about APRS-PSK63 on HF, read the paper in the 24th DCC compendium, and join the APRpack Yahoo Group. Byon, of Byonics Fame, is working with me on developing a possible PSK63 Tiny Trak unit that will smart beacon. The APRpack Group is also working with Patrick, F6TCE, and PA0R, Rein to see if more advanced multimode PSK servers could be created using PSK63F and PSK63ARQ.
Can you imagine the first PSK63ARQ Igate, which can forward SMTP email and POSITS to Findu.com? It could happen if we succeed in all of these projects, and patch PA0R's PSKMAIL open source program.

73, and see you on APRS-PSK63. (Join us on the air using digipan or Multipsk)

Ken WB6MLC

co-moderator of the APRpack Group (a APRS + HFPack spinoff of the 5000 member strong HFpack HF Portable Group founded by Bonnie Crystal, KQ6XA)

Tim-

Easy to interface? ANY PALM WITH A SERIAL INTERFACE. If the PDA and GPS both have a serial interface, that's about the full extent of "easy" on this subject. The models don't matter after that.

Unless you can find a PDA which *hosts* a USB connection for data, a PDA with a USB cable will be useless with a USB GPS, since there's normally no USB host in either device, and USB gizmos don't talk to anything except a host (i.e. computer).

I'd suggest you didn't get many replies because, frankly, there's not much more to it than that. Fancy PDA's with gobs of memory and birght color screens tend to run through batteries very quickly. Cheaper old ones often don't have enough memory for much mapping display. Somewhere in between, pick the point your budget will allow. Mapping & fancy apps WILL eat memory, figure at least a Palm IIIxe with 8MB of memory as a bare minimum.

Bill, I think that most people who use this are so baffled by it that by the time they actually get something to show up on a computer screen they are not sure what buttons they have poked or what software it is that is actually doing the trick.
While this is not exactly what you are looking for there are a lot of good resources and would be where I would start looking. Check out this link.

Stan Horzepa WA1LOU has written a couple of books for ARRL.
If you searched on him or his call in google you might findsome good
info. You could buy one of his books.

Thanks to all for your comments. I've scratched around the web but
haven't found that a-Z tutorial. I may just have to buy the book.

From: KC2MMi
Topic: 2895 Message: 2903

I don't think there's a single do-it-all web resource. The ARRL book, well, seems like it was written to expand the topic to skinny book size but what can you do.<G> Documentation is something most hams are not great at, and systems documentation requiring co-operation among many hams, is probably akin to cat herding.

The tapr.org web site has a lot of the hard data on it. Bob Bruninga has more. And some of the gotchas (i.e., equipment that supports Mic-E only, can only send lat/lon with 60' precision, not full GPS precision) you'll just encounter along the way.

2904. PacComm TNC

A bit off topic, but I figure that someone here probably knows this. Does anyone know of an electronics simulator, where you can create circuits and it will display voltage/current, outputs, timings (for capacitor charges, etc) for general use? I have googled this and have not found anything that was simple, general use, and fairly easy to use. I don't care how primitive or how old it is. Free would be preferable, but non-free would be considered if it was a good program at reasonable price.

2914. PPersistance and Slottime settings.

Yahoo group: APRS (1998 — 2006)
Date: 2005-10-28 02:05:25 UTC
From: Bruce & Leigh Coates
Topic: 2914 Message: 2914

Hi

I posted this to the UIDIGI group but didn't get a lot of feedback so I'll try here.

I'm just preparing to replace a failed UIDIGI digipeater and am trying to figure out what would be a suitable setting for Slotime and PPersistance. Saskatoon, the home of the VE5BNC-3 IGate, has half a dozen highways that radiate out from it. The idea is to set digipeater timing so that it packet tend to travel towards the central digi.

Here's how I think it works if two of my digipeaters hear the same signal from a station half way between them. If this station uses a path of WIDE2-2, my hope is to have the outlying digipeat it first, followed by the central digi where it would stop. What I'm trying to avoid is having the central one digipeat first and then every outlying digipeat the second hop.

Here are the timing parameters that I'm looking at.

Digi will use aggressive timing and will be more likely to be the first to digipeat. This would be used on outlying digipeaters.
PPersistance = 255
SlotTime = 1

Digi will use more relaxed timing and will be less likely to be the first to digipeat. This would be used by the digi in the middle of town.
PPersistance = 64
SlotTime = 10

First, am I right?
Second, should I care?
Third, is it worth trying to fiddle with the timing in the hope of optimizing things?

73, Bruce - VE5BNC

Hi Rusty -

Use LTspice - a free and fully featured spice simulator, sponsored by Linear Technology chip manufacturer.
I guess you won't find a better one (Tried many...)

If you even work on APRS simulation, then contact me.

You find all the links concerning LTspice on a page on my website. Use the english translation flag. There are even links to yahoo groups for LTspice (very active and helpful community):
http://www.ehydra.dyndns.info/Info/Elektronik.html

2920. Frequency?

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-03 02:12:48 UTC
From: Rasputin Novgorod
Topic: 2895 Message: 2920

Hi All:

I've just purchased a GE Phoenix commercial radio for my APRS
node using Ui-View. It has to have frequencies programmed into it.
It ca take 16 channels. I'm located in SW Ontario, Canada.

For my location, what frequencies should I have programmed
into it? I know there is a main APRS frequency. Is there
a backup? Are there secondary frequencies for contesting, etc?

I ask, because I have to pay for each programming visit,
so I'd like to fill the 16 channels with as many possibilities
the first time, hoping to avoid the cost of a reprogramming
because I missed an important frequency.

Sincerely
/b

Great radio for a Digi. Here is my page on how to hook it up:

http://rayvaughan.com/kpc3oto.htm

Ch 1: 144.390

ah.... I'm drawing a blank after that. As a digi you really don't
want anything else in it JUST in case it decides to change channels on
you. As a house radio, I guess the old packet channels, but I think
they're pretty dead now. 145.01 was the one here I think.

Thanks. It's going to be dedicated to APRS. I thought I read about a backup APRS channel. Also, I thought I read about a different channel that contesters used, using APRS for connecting?

2924. DGPS receiver

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-03 13:17:41 UTC
From: iam9z4cp
Topic: 2924 Message: 2924

Hi all,

I have just had a donation of a Leica MX 9400N DGPS Navigator, which we would like to set up as a reference station for APRS here in Trinidad. The problem is that there is no documentation with the unit and the agent here has been unhelpful. The internet has next to no information at all.

Does anyone in the group have documentation on this unit or can you direct me where I can find it?

Many tnx

de Eric 9Z4CP

2925. RE: [APRS] Frequency?

The Kam Plus reference manual at mods.dk has a schematic. It is
not a great copy but might be helpful.

From: KC2MMi
Topic: 2924 Message: 2928

Eric-
Try http://www.leica-geosystems.com/corporate/en/lgs_405.htm

and drill into the GPS products. Leica Geosystems is the division in charge of these products. They can get you a manual, etc.

2929. ANSR-27 Flight Announcement

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-10 15:54:19 UTC
From: kd7lmo
Topic: 2929 Message: 2929

Arizona Near Space Research (ANSR) is pleased to announce the flight of ANSR-27. This high altitude balloon flight will take place on Saturday, November 19th at 9:00 AM MST (1600 UTC). The launch site will be announced closer to the flight date and will be based on winds aloft.

The balloon will be a 3000-gram weather balloon, filled with helium. The expected burst altitude will be 90,000 feet or more. The flight is anticipated to last about 2.5 hours from launch to touchdown.

The flight will feature payloads designed and built by university students through out Arizona.

The flight will also attempt to set two records as part of the 2005 Onset ARHAB (Amateur Radio High Altitude Ballooning Record) competition. The portion we are attempting on this flight includes:

1. VHF/UHF Greatest Telemetry Distance (APRS on 445.950 MHz)
2. Greatest 2-way QSO (Cross Band Voice Repeater)

We need your assistance (especially distance stations) in an attempt to set these records. VHF/UHF stations in Southern California, New Mexico, and Colorado Mountain Tops would work best for the 2-way QSO and telemetry attempts. The following is an approximate coverage map:

http://www.kd7lmo.net/ansr_repeater.html

The following is the payload frequency plan:

Cross Band NB-FM Voice Repeater
Input: 145.560 MHz/162.2 Hz PL tone
Output: 445.525 MHz

APRS when repeater not in use on 445.950 MHz at 10, 20, 40, and 50 seconds UTC time via KD7LMO-11

Landing prediction after burst at 15 and 45 seconds UTC time via KD7LMO-0

Pico Beacon APRS
445.950 MHz packet at 0, 5, 20, 25, 30, 55 seconds UTC time via KD7LMO-11

Our mobile cross band Digipeater will repeat the APRS data to the 144.390 MHz standard APRS frequency and thus will be I-GATED to the Internet for out of area trackers. You track the flight using either of the following links:

http://www.findu.com/cgi-bin/find.cgi?kd7lmo-11
http://map.aprsworld.net/kd7lmo-11

Please pass this message along to other interested parties, espeically those stations that are 300 - 500 miles from Phoenix, Arizona. If you are busy on Flight Saturday, but have a UHF beam and APRS station, consider setting your station up in monitor mode. Point your beam 5 - 10 degrees off the horizon toward Arizona. When you check your APRS log later in the day, hopefully you will have some position reports.

2930. PDA APRS?

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-11 23:33:17 UTC
From: Jeff
Topic: 2930 Message: 2930

Now that pocketAPRS is no longer available, has anyone else introduced a form of portable APRS that is used with PDAs and GPS units? Tnx a lot and have a good weekend.

Jeff/KU4WW

2931. New APRS capable rigs?

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-11 23:43:24 UTC
From: Jeff
Topic: 2931 Message: 2931

Anybody heard if any of the other makers are going to get involved in APRS as Kenwood has? It seems that Yaesu, Icom, Alinco and others are missing out. I use the Kenwood TM-D700a and TH-D7a rigs. I'm still facinated by the D700a's abilities. I'm owned one since 2001. I wish the D700s was available in the US (I think). From what little I can gather, it has the GPS unit built in.

Tnx es 73,
Jeff/KU4WW

Hi, I am a member of the Mountain Rescue Unit of Hong Kong. We are looking for some simple APRS kits including packet and transmitter (144-146MHz). It is so clumsy if GPS, transmitter and packet are individual units in the mountains. An integrated unit is much more appropraite. I found that the Pocket Tracker is out of stock. Is there any other alternatives suggested in the market? Thanks!

Tommy

2941. Skywarn Recognition Day

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-15 15:56:03 UTC
From: alaskaradar
Topic: 2941 Message: 2941

Here is some useful information I am passing on from Bob Bruninga:
(by the way, If you are a NWS station who is paricipating... use
this skywarn technique so I can open my gateway for my NWS KL7FWX)

Subject: Re: [ui-view] Skywarn Recognition Day
Date: Mon, 14 Nov 2005 20:03:57 -0500
From: Robert Bruninga <bruninga@...>
Reply-To: ui-view@yahoogroups.com
To: goldvetter@..., ui-view@yahoogroups.com
CC: Robert Bruninga <bruninga@usna.edu>

For SKYWARN or any other kind of national event,
it is easy to find out the callsigns of other participants
so that you can message them during the event.

Steps are:
1) Send an APRS message to SKYWARN prior to the
event.
2) This will get your message into the FINDU database
3) Now do a FINDU search for all messages to SKYWARN
and this will give you a list of callsigns of participants.
http://www.findu.com/cgi-bin/msg.cgi?call=skywarn

4) Take that list with you on event day, and then
send normal APRS messages to those callsigns
and the APRS Igate system will do the rest!
See details on:

http://www.ew.usna.edu/~bruninga/aprs/aprs-jota.txt

At least it should work. I just checked and right now
there are no messages to SKYWARN. But I hope that
this system works for 7 letter Messages. It should,
but is untested.

While out of the box the IQUE 3600 does not support NMEA, with an application called birdwatch you can TX NMEA out of the serial port (NOT the USB) There is a serial cable available from Garmin, but I wanted to use the car mount. I added a 3/32" connector to the base and wired that to my D700. After twideling with the SW a little I got the D700 to recognize the data from the IQUE 3600
If you look for N2IOF you will see my QTH, thanks to my IQUE.

Tommy, it isn't cheap but the closest you'd come to "all in one" would be buying a GPS and plugging it into a Kenwood TH-D7 handheld radio, which has limited support for APRS built into it along with some special features.

2944. Re: Search and Rescue Applications

For information, TH-D7AG is not officially available in Hong Kong. Kenwood HK sells only TM-D700A. For TH-D7AG, you have to order it from the Internet or purchase parallel imported goods in SSP.

The built-in APRS is easy to use. I am running my APRS node in Hong Kong on 144.525MHz simplex also.

Using TH-D7A is legal in HK provided that it is operated by ham licensees. Kenwood Hong Kong office does not stock this model. But they have limited stock for TMD700. The Ham stores here do not stock any TNC anymore. That's why APRS is not popular here in Hong Kong!

Has anyone built a cable to interface between a Yaesu FT 1500M and a KPC-3 Plus? I wonder if they would be willing to share the wiring diagram?

Thanks, de Scott down Texas way

2948. RE: [APRS] Interface cable, Yaesu FT-1500M to KPC-3 Plus

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-25 04:36:33 UTC
From: Rusty Coleman
Topic: 2947 Message: 2948

Id recommend wiring it like the KPC-3 plus manual says to. Click the link below and turn to page 52 of 260 (which is actually page 42 in the printed book). The FT-1500M has a 6 pin connector like you see on that diagram. You can also wire it differently if you do not want to use that connector, but that connector will be the best.

The 6 pin connector used is really the same thing as an S-video cable connector. You can run down to your local RS and pick up a 3 foot or S-video cable and cut one end off and use it.

http://www.kantronics.com/documents/kpc-3plus_manual_RevD.pdf

Subject: [APRS] Interface cable, Yaesu FT-1500M to KPC-3 Plus

Has anyone built a cable to interface between a Yaesu FT 1500M and a KPC-3 Plus? I wonder if they would be willing to share the wiring diagram?

Thanks, de Scott down Texas way

Scott,

If the 6 pin DIN on the FT-1500 is wired the same as my FT-8800 it is as follows:

TNC RADIO Function
1 1 TX audio
3 3 PTT
5 5 RX audio
6 2 Ground

Ron - K0QVF

Whoops, that one on the KPC manual is 8 pin, not 6 pin. This looks correct to me, I checked it between the KPC manual and the FT-1500 manual.

Hi,

I've built an interface cable using the mini din 6-pin
and a DB-9, as suggested. It receives like a champ,
but does not transmit. I've rechecked my work over
and over, and I'm satisfied it's done correctly.

My RS HTX-202 requires a 2.2k resister and a .1 uF
capacator to make it transmit. Does the FT-1500M
require that same thing.

I have the radio in packet mode and 1200 baud.

Any ideas?

And while I have your attention...what changed would
are necessary to operate a TT-3?

Scott:

By chance, is the RCV light on your KPC-3+ continuously lit? I had a similar problem (no transmit) with a Kenwood TM-G707 (which uses the same cable) due to unsquelched receive audio from the radio, and I had to set the TNC's parameter CD to SOFTWARE. With this setting, the green RCV light is out until valid packets are received.

Bill

2954. Kit for Pharos GPS-360 to handheld?

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-27 15:51:54 UTC
From: tomtillander
Topic: 2954 Message: 2954

The Pharos Gps-360 that comes with, or is associated with, Microsoft Streets & Trips 360, communicates with a computer via USP. Are there any kits or complete units available for interfacing the GPS-360 or other USP GPS receivers to handhelds?

Thanks

73

Tom

2956. New AGWTracker APRS Software

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-28 13:23:32 UTC
From: Beischel
Topic: 2956 Message: 2956

I recently tried AGWTracker from George, the developer of the AGWPE packet engine. I was looking for something to replace UI-View since UIV is no longer being developed and the source code destroyed at Roger's death. Anyway, it was a great application but it lacked dynamic mapping similar to what you find with UIV and Precision Mapping.

Well all that has changed now. George has added Virtual Earth and Google mapping to the product. Now you can zoom in and out, up and down, and side to side. And it even uses your old UIV maps without having to modify them at all. Move/Copy your UIV map directory to AGWTracker (or leave it where it is, it does not matter) and you can use your entire UIV map investment.

When you consider how much it cost to get Precision Mapping, the registration fee for AGWTracker at $49, it is a wash.

So far I noticed that is does some things better than UI-View, and UI-View may have a few things up on AGWTracker (haven't found them yet, just speculating). But since UIV is no longer being developed, this gives some of us UIV users a place to go and a product that is being enhanced and maintained.

George has set-up a directory where you can download his latest beta version which is about to be released. He would just like some more beta testers. Let him know what you think, and what enhancements you would like. He is very responsive.

You can download it here:

http://www.elcom.gr/sv2agw/beta/

BTW, it does require that you use AGWPE (packet engine, which is free) whether or not you use a TNC.

You can download the free AGWPE here:

http://www.elcom.gr/sv2agw/inst.htm

Have fun playing with this new and very exciting APRS program and let us know what you think.

Hi Rick,

I use a PK232MBX as a Digi. I use UI_VIEW software and if you go to the Setup, com setup, Host mode and click on KISS mode and be sure and go to the RIGHT AND CLICK ON SETUP and choose your pk232 mode then enter, you should see your CONV light go on and then your CON and STA light should blink and then you should see the SEND light go on. THIS IS DATA BEING SENT VIA YOUR DIGI.

Here in SE Wyoming we have tried to stay with a WIDE2-2 in the UNPROTO. To see what some of the area digi's look like go to Findu.com and enter in our zipcode 82001.

Hope any of this helps.

2962. Re: [APRS] Programming a KPC3 Plus

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-29 15:06:13 UTC
From: scott laughlin
Topic: 2960 Message: 2962

Hi Rick and Charolette,

Hi,

If you're using something other than UI-View 32 this
information is probably useless.

Assuming you?ve done a Hard Reset on your KPC-3 Plus
(if not go to page 252 in the manual and do that)

You need to be certain you are actually transmitting
some RF. The TNC doesn?t know when the cable is
improperly wired or the radio is turned off, and the
red transmit light will flash whether or not.

Open your UI-View 32 and go to the menu along the top
and click Set Up, then click Comm Set up and check the
following settings:

1200 baud
com port 1 (probably)
data bits 8
stop bits 1
Kiss
(be sure receive only box is not checked)

Click on set up
Click on KAN and a <CONTROL M> should appear in the
upper left corner.

Click OK and then OK again.

Click on set up again and select station setup. In
the unproto address window insert the follow, without
spaces:

APRS,WIDE1-1,WIDE2-1 (Your area may require something
different, but it?s a place to start).

Let us know if this helps. If you still have problems
let us know what kind of radio you?re using.

2963. New APRS Tracker with Receive

Yahoo group: APRS (1998 — 2006)
Date: 2005-11-29 05:32:20 UTC
From: David Smith
Topic: 2963 Message: 2963

Hi all,
I've been working on an 8052 based APRS Tracker for the past semester in college and am hoping sometime mid to late december it'll be ready for initial sale. Any support of my project is greatly appreciated as I hope it can help me pay for college (and what I already owe)

The idea was to have a unit that had a display, to be able to display GPS and incoming data in a useful manner. This would permit anyone with a simple serial GPS unit and radio to not only have tx capability but rx as well.
Initially the idea is to sell this as an assemble it yourself kit but I hope to have pre-assembled and tested units for sale as well.. It all depends on demand.

Initial release features:
Portable
4x20 LCD display (possibly 2x16 can be supported if interest is shown)
Transmit and receive capability
Serial port programmable using menus.
Connects to any GPS with RMC and GGA phrases that has a serial port.
Connects to any radio with ease.
I2C NVRAM and RAM
Upgradeable by replacing the microcontroller chip (socketed)
Simple button interface for switching screen information

Near future features:
Customizable LCD screens
Keyboard and/or keypad interface for messaging capability (this will hopefully be available as an add-on to any version of the device)
Printed circuit board

Some ideas of operational modes:
GPS information display
List of recent stations heard
Per station information display page(s)

Sounds interesting, I might be interested depending on pricing and
shipping conditions.

A few tips that might make it more saleable, get a PCB as soon as you
can, that wil make it more easy for novice kit builders and try to get
a waypoint output to the gps working, people like graphic displays and

the waypoint methode is the most simple.

Hi,

The new send/receive APRS unit sounds interesting.
I'm sure you've already considered many aspects of
where this could lead. But I have some concerns:

1) It should be small enough for motorcycle/bicycle
use.

2) Power consumption should be such that portability
would not be compromised.

3) Cost.

4) Engineered in such a manner than a computer would
not be necessary for the initial set up.

5) It should be made available in kit form.

Keep us posted.

Yes, both are definately on the mind for after initial release. I need to have some kind of demand before I spend the extra money on PCBs. Small quantities of PCBs are relatively expensive, and one of the cheaper places I found does a deal on a certain size PCB for $100 for three but the way things are looking my project won't fit on that small of a PCB (just barely).. I'm thinking the initial release will make the microcontroller available for around $50, with options to buy from me certain other components but that leaves it up to the purchaser to find deals on the other parts. The 4x20 LCD is a standard LCD, and the other couple ICs are widely available. I suppose I could package all the ICs together, thats simple enough.
I'm not sure what you mean about shipping conditions.

The waypoint output is easy enough but for obvious reasons RX needs to work first. After finals this week I'm going to dedicate all my free time to the project so I hope within a week or so to have almost everything working and do some testing.

To avoid taking a big step backwards, please add the following to the feature list of your APRS tracker:

1) Transmit using the Mic-E protocol, not raw GPS strings. (GPS strings make for MUCH longer packets and waste airtime)

2) Use the Smartbeacon algorithm to vary the beacon rate depending on speed instead of just a fixed rate no matter what the tracker is doing. Including some form of "Cornerpegging" as an option would be great also, similar to the TinyTrak.

If you know the size of a 4x20 LCD, i expect the unit to fit in a box approximately the size of the PCB of the LCD, probably 1-1.5" thick. Weather is always an issue for out in the open mobile electronic devices, maybe a zip-lock bag would be an initial solution ;)

>
> 2) Power consumption should be such that portability
> would not be compromised.

This one is a little more difficult to say. I'm obviously keeping this in mind. However, I wouldn't expect a single 9v battery to do the job for very long.

>
> 3) Cost.

Isn't this one on everyone's mind? The most expensive part of course is my time programming the unit. The LCD is one of the most expensive components but can be had for around $20.

>
> 4) Engineered in such a manner than a computer would
> not be necessary for the initial set up.

I hadn't thought about this. In reality all thats needed is the ability to enter a callsign into the device and maybe a few operating parameters.

>
> 5) It should be made available in kit form.

Absolutely. However my current QTH makes that a logistical difficulty but I already have in motion a solution to that.

At any rate hopefully a few folks will be interested in constructing the device from zero with just a microcontroller, if not I'll have to look into other options. Financing is a problem to get this started.

What if, once I had the prototype functional, I started to take pre-orders, and depending on how many I got within the first few weeks would determine my ability to get PCBs made up? If in the end PCBs weren't viable I could refund the money.

Once I have sizing on the device I also still need to find a suitable kit box for it.

I'm not sure what you mean about raw GPS strings. However if you're talking about compressed vs. uncompressed packets, thats a difficult coding procedure. I would definately see that as a near future task but not immediately important as far as making the device work.

Smartbeaconing is relatively simple. I'm not sure what you mean by cornerpegging.

I bet I can explain.

Especially with the case of the byonics tiny-trak the whole setup procedure with a computer is an annoyance, at least to me. The only good thing is that once its been programmed, you generally don't need to change anything..

In the case of my project, having an LCD and a few buttons for navigation, adding some routines to be able to program your callsign and packet transmit times is a relatively simple task. In reality it might be simpler than setting it up to be done through a computer's serial port. On that note, I'm going to consider doing setup via the unit itself to start with. This may actually facilitate my menu driven system idea for programming via the serial port.

Adding a port to plug in a standard PS2 keyboard should be trival, and couple with the LCD display, should make it very easy to configure (for those of us to hate using up/down to scroll through the alphabet)

- jim

p.s. Out of curiousity, were you planning on using a modem chip, or is the 8052 powerful enough to decode directly.

ok now we're really getting ahead of me, but this is great information. the idea of having lots of input as to where the project should go is really making me happy. you've now come to the point where a keyboard would be a necessity-- however i'm going to stress the need for me to get the project up and running with some kind of sales ability.
like i said all of these things i will keep in mind for future upgradeability. adding a ps2 port later is easy as you say.

right now i'm using the mx614 modem chip. i've already got the tx side programmed, crc code is done, however the rx side is more difficult as the modem chip requires 1 start bit + 8 bits of data, and aprs packets dont come that way especially if you start dealing with bit stuffing, so i'm going to have to bit bang the rx side. on that note, tx should be real clean since i'm using tx retiming on the modem chip to send the bits. at this point i'm not sure if i have enough cycles in the 8052 to ensure no loss of data on the rx side, so i may have to employ a pic or some smaller microcontroller to be an rx buffer. with some planning i hope to avoid that.

on another note there are versions of the 8052 that have built in modems, but their size of over 100 pins (being surface mount) is not only kit and development restrictive, but cost restrictive as well.

David,

You mentioned a certain requirement would call for a keyboard.

Here's something to ponder:

About 25 years ago Steven A. Roberts, N4RVE, began a bicycle adventure that lasted a decade. He fitted more electronics on his "Winnebikeo" recumbent than you could ever imagine. Among those early additions were a set of unconventional computer keys that were somehow integrated into the handlebar grips. This arrangement enabled him to operate a word processor, and packet while on the move.

This event took place before windows, when most computers were using DOS or a host of earlier operating systems.

My point: If you need a keyboard you could be creative.

```
Hello all,
I just want to know list of APRS tracker
and the specification like:
- microcontroller
- using modem chip (like MX614) or not
- open source or not
- rx capability
- configurable via software/not
- URL
- price
- and maybe other spec.

i think the popular one is Tinytrak,
but it is not open source.

thanks,
eko

Where did you get this information?

Hi Dave,

The MX614 is in production and has been for several years. There are no plans to discontinue it.

The opentracker is another great example of a tracker kit and it has some neat features too! I might be mistaken, but it might be open source.

Another thought is that with the high availability of under $25.00 GPS
receiver boards, quasi-TNC kits, basic stamps (or old PDAs) and old HTs a person can put together a pretty slick tracker together for less than $100.00 and that is what you have to compete with.

Not that you can't sell something for more than that, or even for that price, but you have to make people understand and believe that what you offer is better than the alternatives for reasons that make people willing to spent the money, and hams are notoriously cheap.

I've talked to kit manufacturers and run several kitting projects for a local club and while you can make some money doing it, as a manufacturer, you will have a lot of costs that you might not anticipate at this point. Those unexpected expenses tend to eat up the profit and more.

The point of all this is that you should be clear on your goals. If it is to design a project for a class, focus on that. If the design is good enough, people will let you know there is a market. Write an article about the project, do a careful analysis and submit it to the ARRL for publication in QST. Start in a small way, work up. If you goal is to invent something that will sell enough to pay for college, that really depends on college costs, but if you are talking about profits of $40,000.00, remember that if people are willing to pay $100 for your unit, and material costs are $70, and you have a really well run company with overhead rates of only 35%, you are making less than $20 per unit. To gross $40,000.00 in profit you have to sell over 2000 units. Over 2000 units? That's almost 86 units a month for two years of sales. In other words, almost three units a day, every day, 365. Technical support. Refunds and repairs. Lost shipments, spoiled parts. Yikes!

Scale is a huge issue in production. Another issue is taxes. Taxes will take as much as 37% of your gross profit. Depending on how fast you earn this, it may affect student aid eligibility. That's not good either. I haven't even gotten into the issue of patenting the idea/design. Build a good enough one and someone reverse engineers it and steals the design because it is cheaper to steal than to do R&D. A patent on a technology device will run between $10,000.00 and $20,000.00 depending on issues and the attorney. Don't do it on the cheap or you will end up a looser. I know from whence I speak.

On the other hand, you build a spiffy device that is easy enough for people to build up from a QST article, you get a good grade and start kitting up, selling a few a month, secure the intellectual property rights to the design and dedicate the non commercial use to the public, you get more good press. Pretty soon, it's a better device than what is on the commercial market and with a little fiddling, the idea gets bought and used on something other than APRS type use (Brunga forbids commercial use of APRS in his license) The royalty payments pay off those student loans in a couple of years and you still get to sell the kits to hams.

Its not hard to be successful, you just need to understand what your prime goal is.

2985. Re: New APRS Tracker with Receive

Yahoo group: APRS (1998 — 2006)

Topic: 2963 Message: 2985

I appreciate the insight.

I've seen various tracking devices of course and my goal as far as the project itself, is this:

Not rely on copying design or code from others. That means doing it myself, or with some friends, but not relying on the product of someone else to "bundle" with my own. The majority of that desire comes from my need to learn how to do it myself and apply what I'm learning to something real.

As far as turning a profit I'm well aware of the quantities involved. My main concern is bringing in some kind of money will at the same time providing for myself and others a device I and hopefully they consider useful and unique.

i dont see the possibility of the device pulling in $40k profit a year but if it brings me something while helping me apply what im learning its worth it.

You mentioned cheap GPS modules, I haven't found any under the $80 barrier.. help? :>

Heh, I just subscribed to this list and the first message I get mentions my OpenTracker. =] It is indeed open source, BSD license. New stuff in the works might wind up being GPL or something else, since it'll have somewhat more commercial value.

>receiver boards, quasi-TNC kits, basic stamps (or old PDAs) and old

When it comes to displays and user interfaces, you're always going to be competing with mass-produced devices like this. Same goes for high-end processing, where it's cheaper to repurpose a low-cost commercial router or access point than to build something from scratch. My objection to that is that you tend to wind up with a kludge, and not something you can consistently produce and support. But you're never going to be able to compete on price with that sort of thing.

>what you offer is better than the alternatives for reasons that make
>people willing to spent the money, and hams are notoriously cheap.

Hams are cheap, but many don't have a lot of time to devote to complicated projects. I was surprised how many paid an extra $20 to get an assembled OpenTracker. It got to the point where assembly was taking time away from development and support, so I contracted out assembly and dropped the price a little bit since it's not cutting into my time so much anymore. Instead of 20 minutes of assembly and testing per kit, it's more like 2 minutes of quality control.

>manufacturer, you will have a lot of costs that you might not
>anticipate at this point. Those unexpected expenses tend to eat up

Big time. And getting started, it's hard to get enough cash together to buy the components you need in the quantities you need to buy to get a decent price. For a long time I was buying parts just about every week. Now my orders are less frequent and larger, and the profit margin has increased a bit due to the lower costs. Some of that has been offset by other factors, like the fact that I provide all of the axial lead parts on a custom tape. It saves me a lot of time (and potential for error) in packing, but it meant buying reels of parts and paying for setup, programming, and sequencing.

>units a month for two years of sales. In other words, almost three
>units a day, every day, 365. Technical support. Refunds and
>repairs. Lost shipments, spoiled parts. Yikes!

Shipping ten times that amount wouldn't be a problem for me - I can pack and ship like crazy, but support is a killer. Everyone wants to use the obscure commercial rig they picked up on eBay, or some boat anchor from the garage,

or whatever. Those are the worst, since I have no way of duplicating the setup. I spend a significant amount of time on support, and sometimes I have to take a wider view and remember that the vast majority of my users are happy and haven't needed any support.

>Scale is a huge issue in production. Another issue is taxes. Taxes
>will take as much as 37% of your gross profit. Depending on how fast

I haven't been hit hard by this so far, but we'll see in another month. I've been offsetting my profits with test equipment purchases, development tools, prototype PCB runs, and so on. In fact, my bank account balance is probably on average about $1,000 higher than it was last year, and I'm not taking any money out for myself. I'm taking a longer view, and using kit profits to pay for new projects with larger markets. It might not be all APRS or even radio related stuff, but in two years I hope to be making enough to be able to quit my day job.

I think Jim, KB0THN, is already taking the plunge. But he's living in the midwest with no kids, and I'm in California, a single parent with two kids, so we have significantly different thresholds for self-sufficiency. =]

>good either. I haven't even gotten into the issue of patenting the
>idea/design. Build a good enough one and someone reverse engineers
>it and steals the design because it is cheaper to steal than to do

Forget patents, unless you have some really clearly novel and useful idea. I have no faith in the US patent system, and it's expensive to even try. For this sort of thing, your best protection is control of your software or firmware. Release it under a license that prohibits commercial use, or keep it to yourself if that's what you want.

I mentioned the GPL earlier, because I'm more concerned about duplication of some of my new projects. For example, I've got a tracker board in the works that drops into an Alinco DR-135T as a replacement for the factory TNC. With BSD-licensed code published, if Alinco decided they wanted to make their own, they could duplicate the hardware easily enough and wouldn't need to do any firmware development at all. Even if I don't publish PCB layouts, I doubt it'd be more than a week's work for an engineer to duplicate. Most of the complexity is in the programming, not the hardware.

>than what is on the commercial market and with a little fiddling,
>the idea gets bought and used on something other than APRS type use
>(Brunga forbids commercial use of APRS in his license) The royalty

If we're talking on-air formats only and not APRSdos software, I'd like to see that hold up in court. For one, spitting out a raw NMEA string over AX.25 is APRS. Does Bob have the rights to NMEA 0183? Does he have the rights to AX.25? I think he could keep you from calling it APRS, but that's about it. The Mic-E format, for example... my understanding is that only a patent would grant control over that. He can copyright the document it's described in, and trademark the names Mic-E and APRS, but without a patent he can't control its use.

But that doesn't really matter, since it would be fairly trivial to change assuming you didn't want compatibility with anything else.

SiRF FS Oncore Module are $36 in single quantity or $25 for a 100.

Deluo has some decent OEM units with integrated antennas, if you want to buy
10 or more. Garmin too, but without the integrated antennas.

Good luck on your project, David. I'm building up nearly the exact same thing, functionally, using an Atmel ATmega8. Sorta like the HamHud, but with the TNC built in to the processor.

Anyhow, in lieu of buttons and whatnot, consider the "spinner" knob like that used on the HamHud. I have had a lot of success with one. It is not dissimilar to using the knob only on the Kenwood D7AG. While entering messages is a bit tedious, for initial setup it's great. Perhaps one other button for "exit", in addition to the "push to select" of the spinner, would make things a bit easier. Very clean though.

That's been a big goal for me too. No better way to understand than by doing. I'm thinking of playing around with a Viterbi decoder next, and maybe turbo codes. I know everyone wants to do high speed, but I'm more interested in increasing efficiency by improving the data encoding format, and using the extra capacity to improve reliability.

My first thought about your email was "Bah Hum Bug" Christmas spoiler. After the joking is all done though you have several good points. I guess part of what you mention was what I was trying to do with the "Ham HUD" comment. If there is already a device on the market that does everything (or even 90%) of what your project does how much demand can you get for another device? If I was designing another two way APRS tracker the firs thing I'd do was find out what's out there and then find out what's good and bad about exsisting devices. People will be willing to pay for your device (even if it's way more expensive) if you can prove that all your features are worth what they are spending. However if all your features (or most of them) are already in another project how do you expect to gain any market share.

Don't get me wrong I'm not trying to be Scruge here just more food for thought. I'm actually hoping your project catches on does catch on. It's just that to catch on you really need to have a better mouse trap than whats already out there and so far it just sounds like most of your project is a repeat of the Ham HUD. Sounds like it might be possilbe to have a built in TNC in the next version of the HUD.

http://groups.yahoo.com/group/hamhud/

You can also do a google search for Ham HUD.

Since you replied to someone else I'm not sure, but it seems like you're really directing the message partially towards me. I'm not really going to get into the difference between my project and the HamHud, more than mine will not have the need for a TNC. My project also has a significantly greater potential for expansion which the hamhud does not appear to have. This probably isn't obvious from the description I've given but that will later become more apparent.

In the end, I want the pleasure to develop this for myself, I'm going to use it and hopefully anyone else that finds it interesting will as well. To me, eliminating the need for an external TNC makes a huge difference and having a full blown TNC in use for a tracker doesn't seem necessary.

On another subject, this project was started as part of a class in microcontrollers I was taking, and the idea came about without any knowledge of the hamhud's existence, and yes I knew the hamhud existed before I decided to hope for interest in the general public ;)

Yes sorry I was directing part of that your way. Need to go to bed before I type messages. Wasn't trying to down play your project just wanted to see if I could expand on what you were planning. I was hoping to push the envelope of your thinking so that you would have more features than the Ham HUD project. If you have something even slightly different than the Ham HUD then you have a greater potential of a long term success. I guess I'd like to see your project not only be a classroom success but a Ham success.

P.S. I've heard rumors that the next version of the Ham HUD (Ham HUD III?) will incorporate the TNCX (or something similar) project. That would place the TNC inside the Ham HUD. I believe that will also give it KISS as an option. Don't quote me since it's just a rumor I heard at this point.

They aren't APRS but I'm thinking they may be an interesting alternative if someone is familiar with Java programming.

Apparently you can buy a Boost prepaid cell phone (wait, don't scream yet) for $99 from them, including an airtime credit and a custom Java applet on the phone. For 20 cents per day--six bucks a month--they say this can have unlimited use of the web interface from the phones, which are Nextel phones with built-in GPS. ($99 for a pre-coded phone, data cable, car & home chargers, and ten dollar airtime credit.) No monthly phone contract needed since it uses the prepaid service and only is using the web service at 20c/day, they say.

And the phones, as currently programmed, can read the internal GPS every xx minutes and then report it back to their server, which is running GoogleMaps to display the positions of all the phones.

So...couldn't this be an APRS resource? Modify the Java code to send the position to a different server (i.e. an APRS server) and if necessary send it in a different format?

I know, that's not ham radio. But it presents an inexpensive way to get a RADIO AND GPS and get that data reported out in realtime from most parts of the country--and get that traffic OFF CONGESTED APRS FREQS.

I haven't verified their claims, I haven't looked at the Java applet, I'm not a programmer. And no, I don't want to spend six bucks a month when a radio could do it for free. <G>

I'm just saying that there's an interesting tool out there, at a reasonable price, that might tie into APRS and the APRS servers very nicely. It would seem worthy of a look, no?

I have my hady in the truck with ant off and I hear the TNC key the radio and send packets out but still cant be found in findu

here again is the equipment

Magellan 315 Nmea v2.1 GSA (this woorks with the laptop)
KPC 3 + Icom 2720

HELP !

if any one is running the same or close set up can you please Email me

if I cant get this to work right I am going to scrap it and go with a tiny tracker and a GE phoenix and a Trimble GPS

any help would be great as we are going to take a trip soon and I would like to have friends track us and chat via IRLP on the way down south

Thanks to every one who is helping me get this up and running !

Rick

Hi,

We don't know the situation, how far away is a digi, etc, but dollars to donuts your path isn't set correctly.

If you are receiving I would open the station window and start highlighting the stations listed there. Click in the lower left corner on *details* and see what shows up in the "effective path" line. Try what they are using for a path.

3003. Final Call for HamHUD II RevE Orders

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-05 02:59:13 UTC
From: J. Rausch
Topic: 3003 Message: 3003

We are ready with the preparation of the HH2RevE!

If you are interested in the group buy please register with Jason (see http://www.ke4nyv.com/hh2revebuy.htm) within a week. The final cost for the complete kit is $113 plus shipping.

After registration has closed you will receive an email with payment instructions. Please (PLEASE) submit your payment within 1 week after you received the email. This is a group buy and due to the total cost we can't afford to finance it (~$6000). Those who haven't paid after the deadline will NOT be able to participate. We will only order the quantity for the paid-for kits. The money will all go to Jason first.
PayPal will be possible but Jason has to add the transaction cost to the price.

As most of us are anxious to get the kit here the estimated timeline which unfortunately is longer then we want it to be: after payment deadline we will order the materials. The pcb has ~3 weeks leadtime but the company doesn't work between Xmas and New Year so we most likely will end up with 4 weeks. The longet leadtime are the cases. We wll get a prototype for final approval firt (2 weeks), the production quantities are the another 7 weeks. Again, Xmas may add a week to this.

73, The HamHUD Team

From: Mike Miller
Topic: 2997 Message: 3005

Hi Jeff,

From looking at the manual page 16, it sounds like memory channels 4,5 and COM can be programmed for both transmit and receive frequencies. Sound like you can set 145.8 receive and 145.99 transmit for ISS packet, or 145.8/144.49 for voice.

At least that is the way I read the manual for split channel operation. I don't have the radio to try it out.

Link works for me. You might want to try it without the) in it.
http://www.ke4nyv.com/hh2revebuy.htm

To place an order go to

http://www.ke4nyv.com/reveorder.php

So you don't make the same mistake I did the Option 1, Option 2, and Option 3
boxes are looking for numbers of units. The blank was so long it confused me.
The Options are explained on the first page at
http://www.ke4nyv.com/hh2revebuy.htm

3009. THD7 and Garmin StreetPilot Colormap connections and settings ?

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-06 17:09:18 UTC
From: Dave H
Topic: 3009 Message: 3009

Hi,

Is there someone somewere using the THD7 and
Garmin StreetPilot Colormap combination please ?

If so, may I have a copy of your radio settings
and also the settings on the GPS itself please ?

I have all the correct cables:
9pin to 9pin joiner
Null connection (if it's required)

I have run out of permutations.

Many thanks in anticipation.

Dave.

3010. Re: New APRS Tracker with Receive

From: Gary Dion
Topic: 2963 Message: 3010

I am probably calling it under the wrong name. It's the knob with quadrature output and push to select.

Through Digikey: "Mechanical Rotary Encoders"
CT3007 is the one I like best.

I just looked on Digikey and they are currently out of stock for some reason. More stock in February.

I've had good success with using this encoder in several projects and in an automotive environment since it's forgiving to fat/gloved fingers. Also, it makes construction a cinch since there is only one hole to drill.

3011. Deluo Lite and Altitude

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-07 15:25:28 UTC
From: w3ce_qrp
Topic: 3011 Message: 3011

I have a Deluo Lite on my mobile (w3ce-9) connected to a TMD700. I realize the the altitude reading from almost all GPS receivers is suspect. The Deluo reads almost 375 feet low no matter where I travel. My Garmin unit usually is no more that 50 off of actual altitued. Anybody else notice this much error?

It kind of neat to be below sealevel at the bottom of the Lehigh Valley in PA. (about +250 feet actual).

Mine usually work pretty well. As well as you'd expect, anyway. Are you sure the Garmin unit doesn't have a barometric altimeter? =]

The altitude output is geoid height, I believe, and not MSL. Here's more information than you probably wanted to know:

http://earth-info.nga.mil/GandG/publications/vertdatum.html

(I'll have to bookmark that one.. very useful.)

The Garmin does have a barometric altimeter, but I calibrate it to
the GPS altitude, so the reading is technically from the satalites.

Date: 2005-12-08 11:42:17 UTC
From: Dave H
Topic: 3009 Message: 3015

Hi,
Is there someone somewere using the THD7 and
Garmin StreetPilot Colormap combination please ?

If so, may I have a copy of your radio settings
and also the settings on the GPS itself please ?

I have all the correct cables:
9pin to 9pin joiner
Null connection (if it's required)

I have run out of permutations.

Many thanks in anticipation.

Dave.

3016. Re: Deluo Lite and Altitude

Al, unless you have an "aviation grade" GPS you are probably best off ignoring the altitude readings. Most GPS chips/units are optimized for "flatlanders" who just need a 2D position fix and apparently, ir order to get that altitude (3D) position computed the units have to do a lot more math, use more horespower, consume more CPU cycles, have better algorithms in them...

Bottom line, if you need to know what altitude you are parachuting down from, you'd better buy one certified for "aviation" use.

Or the special ones sold for use on submarines.<G>

My $200 Magellan gives me altitude and works just fine. It's not "one
certified for "aviation" use".

From: Nick B.
Topic: 3018 Message: 3018

Hi,

As a newbie to APRS I have an old Kantronics KTU Weathernode that I would like to use to broadcast APRS weather data. I need to devise some kind of interface to get this working with a TNC. Can someone point me towards the docs where I can find what format the weather packets should take?

Also, out of curiosity has anybod already interfaced a KTU to any APRS system? I've googled but found nothing!

Many thanks,
--
Nick G4IRX

Dave,

I had similar problems with a garmin 60cs.....
I found the posting below on eham.net which got
mine working. Mayhaps you have the same problem.

Oh yeah, don't bother looking in the Kenwood
documentation, cuz it ain't there.

rob
N3HU

Here 'tis:

I, too, use a Garmin eTrex Vista with my TH-D7A(G). So, I should know
a thing or two about this!(lol) The manual suggests (and I follow to
the letter) is to make sure the devices are turned off before
attaching them. Turn the GPS on, then turn the HT on. When the HT is
ready, push the TNC button once. If the BCON letters don't appear just
to the right of the TNC icon, you must push the BCON button. At that
point, you should see TNC====== BCON. If you see the word packet
(TNC====== PACKET), you've pressed the TNC button once too often. Turn
it off then turn it on again by pressing the TNC button (once only) again.

If that doesn't work, make sure you go to menu setting 2-C (APRS Menu)
and ensure that DATA TX is set to AUTO. MANUAL/PTT will not send data.
Go to menu setting 2-D, where you can set the time intervals for auto
transmit.

Although the latter information is based on the HT only, (meaning, it
has nothing to do with data flow between the GPS and the HT), it may
help solve other issues.

Also, check menu setting 2-2... Make sure that this is set to NMEA -
as well as the GPS. If they don't match, they won't understand each other.

I hope I was able to help you solve the problem. If not, you should
post this on the ELMERS section... You might get more responses. Good
luck and 73!

From: David Smith
Topic: 3020 Message: 3020

Those of you interested in the Display Tracker be sure to keep watching the page at http://www.radiotec.org/dtrack.

I have received a couple pre-orders so I'm making updates to the page daily as I progress. It contains a list of to-do items before initial prototype as well as some sort of indication as to completion of each item.

So far I have the secondary PIC controller code all written and simulated, and part of the 8052 code for communication with the pic written and simulated (access to the PIC's eeprom memory) by the end of tomorrow I should have the radio portion of that 8052<->PIC communication code written and simulated. Thursday I will be working on packet send and receive code. The PIC is being used as a buffer between the radio and main uC, the PIC will take care of DCD and start/stop flags, leaving the main uC responsible for making sense of the data it receives and wants to send. This means I won't be relying on an energy-sense circuit, nor on a DPLL circuit, which is why I chose this route, the PIC has plenty of free time on its hands to be monitoring the radio data :)

dave

(p.s.s. NRZI with bit stuffing and HDLC flags will be blamed for my high intake of Sumatra this week.)

3021. RE: [APRS] dtrack update..

Good luck with that. I guess it's a little late now, but here's my writeup on NRZI and such:

http://n1vg.net/packet/index.php

There were quite a few headaches involved in figuring out that stuff, so I can sympathize. The docs that are out there suck, and in some cases (AX.25 2.0 spec) are just plain wrong, and won't ever work if you do exactly what they say.

Do you have an estimate of the cost for a full kit? LCDs are often a killer in small quantities. I've got plenty in various sizes that I've picked up from surplus outfits for my own projects, but I've never had a stable enough source of cheap LCDs to do an affordable project using them.

I see that you're not planning to provide updateable firmware. That's your choice, and I understand your concern from an IP perspective, but keep in mind the extra burden that implies if you find a bug after the product ships. Something I've considered for the more advanced projects I've got in the works is an encrypted bootloader. In the extreme case, each device would have a unique key burned into it and tied to its serial number in a database. That'd let you control dissemination of paid upgrades. I'd probably just go with a single (per-model) key for simplicity. With the security features of most modern MCUs, it'd take a major effort to extract it.

What 8052 are you using? That's an old school processor, though I guess there are plenty of new chips out there with 8052 cores. The HC08s I'm using have a core that goes back to the old 6800s, circa 1975, but they've had a few enhancements since then. =] I'll still take just about any von Neumann architecture chip over a Harvard chip any day. Unless it's for DSP, anyway.

Any particular reason for the MX614? CML's got some other chips out that'll do DTMF and can take some of the interrupt load off the processor. My own RX-capable tracker (the current generation, anyway) is using a very old-school XR-2211 demodulator, plus PWM synthesis for the TX side. The '614 is probably a cleaner solution, but my approach is flexible and about 20% of the cost. And besides, I don't like dealing with CML.

3022. Re: dtrack update..

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-14 06:59:25 UTC
From: David Smith
Topic: 3020 Message: 3022

I've read your page, but thanks for sending it again. You've reminded me of a potential problem I have in my coding. Right now its set up so that if I get 5 1s, then a 0, then another 1, the 0 is zapped. But from your description of stuffing, I might get 5 1s, then a stuff 0, then another 0 after that, still having to remove the 0. Whoops! thats an easy fix. :)

The rest of it I seem to have gotten right. You're right about the documentation. I did a lot of reading before I started writing code.

As far as a full kit cost, I haven't gotten quite that far yet. The LCDs are a problem but I'm using a generic obviously, and I've found them for under $20 shipped new and in quantities up to a few hundred at a time. This isn't a great concern at this point as LCD mounting is going to be flexible. Back to cost. I'm hoping the project kit, complete with everything, board, maybe a plastic case, somewhere around $100.

As far as bugs after the product ships, thats going to be an issue I will probably have to deal with. I'm not sure what I can do about that really.

At the moment I'm using an AT89CRC51. They are still in production, and not very expensive. I'm also using a PIC16F818 as the secondary to directly talk to the MX614 chip. The main reason I went with the 8052 based chip was the fact that that is what I learned in class, and I'm getting good at programming it :) At any rate, its a 40 pin socket, gives me lots of pins, and I've got a lot programmed for it already from other projects that directly applied to this one. There are also some other much faster drop in 8052 chips available that may be a future upgrade for the project.

One reason, it's already been used in packet application. When I started this project some time ago I didn't really want to go too far beyond my understanding and skills. I have another CML chip in my hands that does DTMF and other types of modulation but its much bigger. And it was fun to learn how to program PICs, (obviously useful) and its a small, inexpensive chip with EEPROM that will be useful in the project. Previously I was hunting and hunting for a i2c bus chip with any decent amount of nvram and gave up, the PIC proved opportunistic. With almost no effort a PIC16F819 could be used in place of the 818 to double the EEPROM size.

I haven't had problems with CML yet.. obviously they sent me samples.. whats been your experience with them?

3023. re: dtrack (bitstuff)

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-14 18:04:04 UTC
From: David Smith
Topic: 3023 Message: 3023

Looks like it was late last night and I sent myself through a loop..

Checking the code for bit stuffing, I indeed had it just fine for RX..
In TX mode, there was a problem where after every byte it would reset
the bit stuffer, it dawned on me that is most likely wrong and bit
stuffing can occur if you get the last few bits and first few bits of
two bytes as 1s.. so easy fix anyway.

my rx code has any time that there are 5 1s received a bit is set, and
if the next bit is a 0 it gets wiped.

Jay -
I'm very new as well.... however, based on a little googling I'd guess the DC in TFC-DDC stands for Dodge City.

This page provides a map showing the location of a node identified as TFC-DDC in the northwest corner of Dodge City, Kansas. It also shows the last packet received. It looks like the report this time was 25 in 10 minutes.

I'd guess that is either weather related (e.g., 25 lightning strikes in 10 minutes) or a report of packet traffic (TFC?)....

I'd also guess that K0SUN could provide a definitive answer.....

http://www.findu.com/cgi-bin/find.cgi?call=TFC-DDC&topo=8

Position of TFC-DDC --- 1.3 miles northwest of Dodge City, KS --- Report received 39 seconds ago

TFC stands for Traffic and the DDC well anything you like. In this case it's packets in X number of minutes. That makes the 25 in 10 mean 25 packets in 10 minutes. I'm glad you asked because I tried to google for the answer when I started APRS and finally had to email the SYSOP of a local Digi for the answer. Most of the TFC's I've seen are right on top of the Digi but some SYSOPS have moved their traffic counters off to the side of the Digi a little so it doesn't cover up too much of the map. If you want to generate a TFC icon yourself their is a plug in for UI-View. I would put in a word of caution though, if you don't have to send extra packets in a busy RF network don't. Ask around other local Hams should be able to help answer the question of how busy the RF network is.
--
Totally mad. Utter nonsense. But we'll do it because it's
brilliant nonsense.

3028. a Christmas Message to all

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-18 16:53:08 UTC
From: Wayne T. Miles
Topic: 3028 Message: 3028

During Christmas, we gather with family and friends to celebrate the Christmas season. As we share love and enjoy the traditions of this holiday, we are also grateful for the men and women of our Armed Forces who are working to defend our freedom.

This Christmas, may we give thanks for the blessings God has granted us in each of our lives. May the joy of the holidays renew our commitment to working together for a better community with peace, opportunity, and hope.

At this time of year we all need a moment to remember patience and good will. The sentiments below are worthy, whether you pray to God or seek your own inner guidance.

Heavenly Father, help us remember that the woman who cut us off in traffic last night is a single mother who worked nine hours that day and is rushing home to cook dinner, help with homework, do the laundry and spend a few precious moments with her children.

Help us to remember that the pierced, tattooed, disinterested young man who can't make change correctly is a worried 19-year-old college student, balancing his apprehension over final exams with his fear of not getting his student loans for next semester.

Remind us, Lord, that the scary looking bum, begging for money in the same spot every day (who really ought to get a job!) is a slave to addictions that we can only imagine in our worst nightmares.

Help us to remember that the old couple walking annoyingly slow through the store aisles and blocking our shopping progress are savoring this moment, knowing that, based on the biopsy report she got back last week, this will be the last year that they go shopping together...

Heavenly Father, remind us each day that, of all the gifts you give us, the greatest gift is love. It is not enough to share that love with those we hold dear. Open our hearts not to just those who are close to us, but to all humanity. Let us be slow to judge and quick to forgive, show patience, empathy and love.

And lets not forget the fantastic opportunity that our club has given us to meet, celebrate life, make new friends and help people in need. It is wonderful that we can turn our hobby into a public service that reaches out and touches so many.

In the coming year, I hope that all of you will keep these thoughts in mind as we prepare for our biggest fears during hurricane season,

and that we will all work together to be ready and prepared.
I wish everyone a joyous and happy season and if you travel, a safe return.

Merry Christmas!

3034. RE: [APRS] WINAPRS question - how to block or exclude weather stations

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-17 05:27:08 UTC
From: Bo Black
Topic: 3027 Message: 3034

Hello Chuck, I assume that you are running Winaprs via tcpip. The only way that I know that you can filter out the weather stations from showing on the map is to connect to a "filterable" port ex:14580 and use the -b/CW* command string. I believe that in order to do that, you have to be a registered user. Hope this helps. 73 Bo KE5COY

Subject: [APRS] WINAPRS question - how to block or exclude weather stations

I have justinstalled WINAPRS,trying it out, and I am trying to figure out how to turn off the weather stations from displaying on the map.

Chuck

3036. APRS users

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-21 09:39:41 UTC
From: hxc98
Topic: 3036 Message: 3036

If you use MapPoint with either APRSPoint or UI-View, you can update MapPoint 2004 with the latest map data very inexpensively. All you need is a copy of Streets 2006 or AutoRoute 2006. Go to http://www.aprspoint.com/ for step by step instructions.

3037. using Kenwood D700 & ISS for APRS

Yahoo group: APRS (1998 — 2006)
Date: 2005-12-21 23:35:39 UTC
From: kbrackins
Topic: 3037 Message: 3037

Is it possible that someone might point me to a web page that might show me how to set up the KW D700a for using APRS on the ISS?

Bruniga's page is showing a frequency of 145.800 with an offset of +0.11 0 Mhz. (145.990) I can't seem to figure out how to program in the offset for the uplink. I've reset the path as indicated.

I'm getting hairless so I have none to pull out!

Thanks,

Kevin

Merry Christmas and Happy New Year

Now for my problem.

I have an AEA PK-12 TNC for APRS which was working fine then suddenly I get only jibberish on my computer when I turn it on. In addition all the lights come on. I do not have a manual to see what I need to do to get it back to normal.

I tried pulling the jumper near the backup battery with no luck. I also tried setting the baud rate to the various ones available (4800, 9600, etc).

Anyone help would be appreciated.

Thanks,

Richard, KR4XN

richard
when you try to "talk" at the tnc,what software you using?
are you in windows 98 or xp ?

is there a batterie on the board,change it if you have one,,,they dont last
for ever.

it is like it lost his KISS ON setup,

also try to talk at it at 300 bps not 1200 or 9600
if it reset it will go back at this speed by default

gervais,ve2ckn

Sounds like it's lost it's settings. Bring up a terminal program at 4800 baud and when you turn it on, start typing asterisks at it to see if you can get the auto-baud sensing to work.

The backup batteries last about 5 years, so you should plan on replacing it.

The asterisks thing worked! Thanks much and I guess I should replace
the battery since it is about ten years old but still holds settings.
Now to see if I can find a manual.

Thanks again and happy new year all!

From: aprsforme
Topic: 3048 Message: 3048

Hi Everyone,
Need help on the wiring of the Radios they are FT530 and Icom IC706MKII I am trying to wire up a Micro TNC PLus from www.elcom.gr and using UI-VIEW the radios recieve ok but do not transmit they were wired as per the manuals I also am wiring up a deluo GPS but nothing is transmitted out. When the F9 key is hit to sent a beacon nothing happens. If anyone can help I am it will save alot of headaches on my part. Again Thanks

3049. UI-VIEWER VS WINAPRS

Hello. Possible, someone might have already asked this question; but thought I would toss it out for a quick discussion. Which of the software programs are better at manipulating within the map screens, which program gives you more detailed and high quality map screens, (knowing you need map overlay's) and which map overlay would you recommend for such results? I have older version of winaprs and precision map 3.0 and like to upgrade to UI-View with precision map 7.0. Comments, suggestions; please? Thanks! Mike

Hi Mike:

I use Precision Maps 5 and it works in BOTH WinAPRS and UI-View. I like UI-View mainly because it is a more refined program and is more flexible.

73, Jamie

3051. APRSPoint new version available !

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-09 06:12:30 UTC
From: hxc98
Topic: 3051 Message: 3051

APRSPoint 2.2 is released. New features include,

1. Added TNC data view and TNC data log,
2. Enabled auto connect for AGW packet engine,
3. Fixed a bug handling weather station data,
4. Ability to load a default map view at startup,
5. Restore TNC settings when program exits.

and many more. The holiday sale is also extended for 2 more days.
Visist http://www.aprspoint.com for details. Thanks.

3052. Lone Survivor KC8VKZ of Coal Mine Disaster

3054. Kenwood TH-D7AG performance and GPS interface questions

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-15 21:06:31 UTC
From: kb1dni
Topic: 3054 Message: 3054

Hello everyone:

I am considering purchasing one of these HT's and I wanted to hear some of your experiences and ask a few questions. I wondered if anyone is using one of those low voltage GPS units and if the radio powers the GPS. I was considering buying just a 2 meter HT and using a Tiny Trak but owning the TS-2000 I could tinker with Sky Command with this HT which might be fun.

I wondered if the GPS interface is easy and straight forward. I also wondered if anyone is using their laptop with this HT for sending and receiving messages and how that is working out.

I a new to this mode and want to make a good choice. I will be using it primarily mobile but would also like to use it for special events, search and rescue and perhaps on my ATV while out in no man's land.

I will probably make a travel kit for quick interfacing with different installations.

Thanks for your time and for sharing your thoughts and experiences.

Plug and Play 100% and I would get one while they are still available. The Kenwood TH-D7A(G) is plug and play with a hand held Garmin eTrex (and many others). With a full featured GPS like this you can send your position and display the position of others. I am in the HFPACK group and we use our D7s to text message hf schedules. My typical QSO is from southern cal or arizona to San Francisco, the longest to Amsterdam. All via the APRS-IS servers on 144.39 . The stock antenna was replaced with a long whip but a full size comet 2 meter mag mount is used while traveling.

In all, the D7 is magic, I carry it all the time but have never used it for voice comms, I don't think it is very good in that department.

Besides being a fully self contained Packet radio/TNC/Terminal, it can interface directly to the 9 pin connector on a laptop where it will exchange all data with UIVIEW or WinAPRS (my favorite) USING THE D7 PACKET MODE. I've also used it with DOSAPRS on tiny old DOS laptops.

Its all plug and play so read the book carefully, also go to the kenwood USA web site and download the advanced programming book. For some reason one of the important settings is buried in a footnote but I covered that here; set gps on to nmea;default 4800 baud; set gps digits to 9; set waypoints. In the Garmin Etrex, setup menu, interface menu in/out is NMEA.

As you know, most folks never read the user manuals but this radio REQUIRES reading. Ditto most new hand helds.

For GPS/D7 setup, press the D7 functions to display TNC and BEACON. It is necessary to set GPS to NMEA in the D7 menus (easy) and WayPoint number of characters to process (9). The Garmin setup interface menu is set to output NMEA.

It is very important to power up the GPS FIRST, pause then turn on the D7. 'Initializing TNC' will display. Give ample time for the GPS to lock onto signals then push the D7 POS key and your position region will display.

When attaching the D7 to a PC, select the D7 PACKET mode, the PC software is the TNC. Then start the PC, UIVIEW or Winaprs. We use new software called APRS-SCS.

The default baud rate for both the PC port and the GPS port is 4800 baud, don't mess with it.

A 3 wire data cable comes with the D7 to attach to either a PC (add connector) or the GPS (add connector). There is a third party on the

internet that supplies an excellent heavy duty combination DATA cable and GPS Cig Lighter Power adapter cable.

THe D7 uses internal batteries (2.5 watts) or external 12VDC cig lighter adapter for 5 watts output. Caution, it does get very warm with 12-13.5 volts but I've run it up to 8 hours without problems.

The D7 DOES NOT POWER the GPS, period. eTrex batteries last about 24 hours.

YOu will find the D7 extremely easy to use and to repeat, it is plug and play with my little Garmin and most others. There are many hidden features that you'll find in time that make it easy to use.

I don't have the name of the 3rd party that makes the combination data and GPS power cable, just search the internet.

Caution, the little eTrex is too small to safely use when driving unless you have excellent eyes. I use a separate GPS system while driving.

BTW, I only know of one small harmless glitch, someone said the D7 was full of problems but I suspect they never read the books.

Enjoy ..... BTW, the D700 is also similar and easy to setup.

From: c brainard
Topic: 3056 Message: 3056

Here is my two cents -

If your going to get that Kenwood HT get the better battery - read the specs -I don't think the the radio will not transmit at 5 wats without the better battery - more money you have to spend on top of the cost of the radio.

Check and see if you have any digi's or IGATEs in your area that might hear a 5 watt or less signal coming from a rubber duck antenna before you do anything or else you will be transmitting your location all day and never see it on Findu.com or what ever program you are using like WINAPRS, or UIVIEW.

Regarding the GPS getting power from the radio - not sure about that.

If you go to the tiny trac web site you will see some examples of people who have built some cool units with a tiny trak, a 2 meter radio, and a gps in a nice package. Pretty cool, and maybe less money then a new Kenwood with the more expensive battery.

The Kenwood is a nice radio, but I think it's a little pricing unless you are going to use the display to watch the data, and send messages.

Anyway - like I said just my thoughts.

3057. Re: Kenwood TH-D7AG performance and GPS interface questions

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-16 22:16:04 UTC
From: KC2MMi
Topic: 3054 Message: 3057

Glen- <> The D7 has no provision for providing external power to any device. As far as I know, no h/t has any provision for powering an external device and even if you kludge it...GPSes suck power. I have a 10xAA pack that can be velcro'd under my radio and plugged into the external power socket to run the radio at 12V 2000mA....but haven't complicated life by making a GPS power feed from that. I just use 4xAA for the GPS and more velcro, so I can swap "any" GPS with its own power source and not get more cable messes. <> The radio manual, and extended (APRS etc.) manual for the radio can be downloaded from the Kenwood US web site. The radio really has next to no GPS interface or menus, you do that on your GPS. <> There's only one h/t that supports GPS or APRS to any extent, there's not much choice to be had or made. The D7 is a poor choice in that it only supports APRS MicE protocol and it truncates GPS data from the usual DDD.MM.mmm format to just DDD.MM.mm so you can't get better than a 60' position displayed or sent. But then again...there's nothing else available in an HT with the same features or integration.

Bill:

Thanks for the in depth information. I am serously considering buying one. I go up north a lot and it would be handy to have mobile as well as portable. I like to hike in the woods, snowshoe, etc and it would come in handy.

Not to mention public service events like marathons and emergency situations.

Thanks,
Glen

I appreciate your time in responding. It is a wonderful hobby, people are very supportive and share there experiences, etc. It can be a very expensive hobby so doing your homework and research prior to purchasing is a wise thing to do. I currently have a Magellan Meridian Gold GPS and don't see any premade cables on the internet so I'll have to see if Radio Shack sells DB9 connectors to use with the factory cable interface for the HT. I may be better off buying the DB9's online from another supplier. I may end up making a couple different cables for different rigs. Thanks, Glen --- In APRS@yahoogroups.com, "KC2MMi" wrote: > > Glen- > < radio powers the GPS. >> > The D7 has no provision for providing external power to any device. 3060. Kenwood TH-D7AG performance and GPS interface questions

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-16 16:24:10 UTC
From: Jerry Heald
Topic: 3054 Message: 3060

Glenn,
>I wondered if the GPS interface is easy and straight forward. I
>also wondered if anyone is using their laptop with this HT for
>sending and receiving messages and how that is working out.

Kenwood includes a patch cable to mate to a GPS unit of your choice. The cable has a plug on one end that fits the TH-D7AG and the other end is just bare wires. I picked up a "wire it yourself" serial connector from Radio Shack to make the connections to the laptop.

I have mated the TH-D7AG to a Lowrance iFinder GPS and a laptop running WinAPRS. That is a lot of wires and pieces to deal with in a moving vehicle but it does work.

I have used the TH-D7AG in packet mode with a laptop and a packet BBS. Connections were erratic. Sometimes it would connect, sometimes not. Not sure why.

Don't know if the GPS draws power from the TH-D7AG but am doubtful.

3061. APRS Server login

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-17 03:00:20 UTC
From: bradysmall
Topic: 3061 Message: 3061

I have been trying to design a program that will log the APRS data stream, but the only problem that I have been having is how to actually log into the server.

I have done what has been described here..

http://www.aprs-is.net/valid.htm

I only need read access.

I can successfully connect to the server via TCP/IP. And when I send in a login, all I will get is a heart beat of the server, usually the server version number and its address every 20 seconds or so.

I'm expecting a flood of data to be heading my way once i send the login.

Any clues to what I might be doing wrong?

Thanks,

Brady

> I may be better off buying the DB9's online from another supplier.
> I may end up making a couple different cables for different rigs.

I may not have the best prices on DB9s (hard to compete with the likes of Digi-Key!) but I'm trying to make a point of expanding my packet radio-related connectors and things:

http://www.argentdata.com/catalog

I've got DB9s, Garmin connectors, Powerpoles, and so forth. I finally found a factory in China that makes speaker-mic cables (sturdy non-coiled ones) and I've got a batch of those on the way soon. They're really nice for making up HT cables.

Bill--
<<Besides being a fully self contained Packet radio/TNC/Terminal, it can>>

That's just about the complete opposite of everything I've heard from anyone using packet radio, as opposed to APRS. The D7 brochure says in the fine print "one packet, one frame" and you are the first person I've heard of who suggests these radios are being used for general purpose TNC, or for any general purpose packet radio purposes.

Are you using it for more than APRS? Either there is a major imsunderstanding from a lot of users, who tell me they can't use the D7 for packet, or you're one of the many, myself included, who were totally mislead by Kenwood.

Like they said in "Red October": "Give me ping, and one ping only." One packet, one frame, no streaming packets because there is no real buffer space and no software flow control to be had.

No?

3064. Battery [was] RE: Digest Number 951

CB-
The D7, in the US, has shipped with Kenwood's "best" i.e. high voltage battery as standard at no extra cost for at least two years now. The radio will provide more power if used with a 12V external source but there is no battery pack "stock" or aftermarket that provides more than the 9.6V of the standard battery. Some third parties provide more amp hours, that's all.

CB:

The standard Battery for the D7 is the PB-39 600mAh at 9.6 volts which provides EXTRA-LONG LIFE Nickel Hydride battery; provides 3 Watt TX output; Batteries America has a PB-39 which is 1100mAh and provides LONG LIFE Nickel Hydride battery; provides 5 Watt TX output at 9.6 volts or PB-39h, which is 1400mAh EXTRA LONG LIFE Nickel Hydride battery; provides 5 Watt TX output at 9.6 volts.

I hope this helps I use the 1100 ant it works great but my next will be the 1400.
As Tim the Tool man say's MORE POWER!
Except we are supposed to use less power except here in the west you need it just to hit the repeaters.
Good luck!

3067. reatime tracking w/ bread crumb trail

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-17 18:57:09 UTC
From: John
Topic: 3067 Message: 3067

Dear Group,

I belong to a Geocaching group that likes to take monthly hikes, 2 of us are hams and are active on APRS. We would like have real time tracking loaded up to the internet so that fellow cachers at home could watch our progress at home on their computers. The people at home would need to access a sight, have that sight automatically refresh every few seconds, show our progress through the hike on a topomap and have a breadcrumb trail. It needs to be able to show more than one track. It would be a plus to be able to access this same file at a later time when the hikers are all home to be able to see their previous tracks.

I'm sure someone is already doing this, perhaps during SAR or public service events. But all the looking I've done on the internet and in this group has either been too complex or confusing for me to understand what I need to do to get started. So, if anyone wants to be an Elmer for me that is already doing what I need please e-mail me direct at k2qy@... FindU doesn't really have what I need although some of the features are there. The automatic refresh being a major draw back. The topomaps there do not have breadcrumb trails and could be zoomed in a bit.

Thanks in advance and keep on trackin!
John

Maybe connecting to the wrong port, or a filter port without a filter defined? Try connecting to the server with your web browser on port 14501 and see what ports are available and if you connection shows up.

I went through exactly what you are going thru last year. I first went with the tt3, a Garmin GPS18pc and a handheld. Then I decided that I wanted to use UI-View in the car too. So I upgraded to the TNC-x with the tracker add on and the USB add on. This gives you the most for your money and it is relatively small. It also lets you use the laptop when you want or you can run it as a tracker. All of it runs off my cigarette lighter.

My recommendations for the small GPS would be either the Deluo GPS Lite (or WAAS) or Garmin GPS 18. The 18 is a bit more expensive and it's larger, but probably better for outdoor mounting and works above 60k feet altitude, though for most vehicles that's not an issue. =]

I'm a little biased when it comes to trackers, but a KPC-3 is way too expensive for what it does. It's a dumb device (for APRS anyway) and for $180 won't perform nearly as well as an OpenTracker or TinyTrak at around $30 (kit). Of course, you can do messaging and such with it that transmit-only trackers won't do. If that's what you're after, I'd suggest the Elcom musbtnt. It's around $100, last I checked.

The new TinyTrak 3+ has a bigger regulator, so you can run a 5-volt GPS off it. My own OpenTracker 1x has the same sort of regulator, plus a few other features like locking DB9 connectors, but at the moment it's only available assembled - I'll have kits in the next few weeks when I get some supply issues ironed out. Again, I'm a little biased, but I like it for a way to get started. I just packed up an OT1x plus Deluo GPS and sent it to my dad, KB6VAA, back east. I know all he has to do is set up the radio cable and he's ready to go.

The TT3 is a good product, and I think Byon actually beats my price by a little bit last I checked, but I think the OpenTracker gives you more features and more expandability. The free firmware updates are a major difference, and the OpenTracker has temperature and voltage sensors.

3072. Re: [APRS] whats a good mobile aprs setup?

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-18 00:14:54 UTC
From: Jason Rausch
Topic: 3069 Message: 3072

Hey Mike, welcome to the world of APRS. You really have a few good options to get started in the mobile aspect. Sounds like you have a pretty good idea so far of what you will/could need to get going. I'll try and go over a few setups that I have experience with.

First thing to decide is what kind of GPS do you want: With a display or without a display? For mobile, I always suggest simple and low current draw. For this, I really like the Deluo GPS Lite GPS "mouse" module. The homepage for these can be found at http://www.deluogps.com but I suggest buying it from Scott N1VG at his online store http://www.argentdata.com/catalog/ This one is nice because it is the receiver and antenna in one small box about 1.5"x1.5"x0.5". The receiver needs 5VDC and it spits out standard NMEA format at 4800 baud serial...sutable for just about any mobile APRS application. I currently have one in my truck sitting on the dash. I used a 7805 regulator with a decent heatsink to supply the 5VDC.

Looks like you already have a radio decided on, an HT, so I won't bother much with that part. I'll just throw in that I use a couple of commercial Motorola GM300's and M120's for my APRS radios. They take a beating and keep going. Especially the one I have in my digipeater.

As for the TNC/Computer situation, you have a few good options. But you have to decide, do you want to transmit only or transmit and receive?

If you are only worried about reporting your position then a TinyTrak III http://www.byonics.com or OpenTracker (personal favorite) http://www.n1vg.net/opentracker/index.php is the way to go. These are transmit only modems that only know how to take in position data from the GPS and make an APRS formatted packet. Thats it, no more and not much less. With these modules, you only need the computer for inital programming of the callsign, path, position comment, ect.

For me, I like the ability to receive, especially knowing the distance of other stations and also messaging. I also don't want to have a full laptop in the truck to do this. I am willing to give up mapping to have these other "text based" features. In comes the HamHUD II http://www.hamhud.net/hh2 The HamHUD is a terminal-like APRS client. It gives you all of the features of APRS minus the mapping. Including messaging and weather data. I won't go all into the features because its too much to list here. I will warn that this requires a full TNC2 clone TNC to function. We do however have it working with clones and not just the KPC-3 as before. One more highlight to mention is that the unit is user-flashable with firmware upgrades and the firmware and code is pen source. The link will give you all of the info and if you are interested, email me at jason@... and I can help you get one of the new kits we are currently putting together. I know this sounds like a personal push on this...well, it is. Since I have been heavily involved in the project for many years now.

If you do go with a laptop/computer option. There is really no better choice than the TNC-X kit from John Hansen W2FS http://www.tnc-x.com for full APRS use with any application that speaks in KISS protocol. UI-View works flawlessly for me with the TNC-X. The TNC-X is also USB capable and can get it's power from the USB port, eliminating the need for an additional power cable just for the TNC.

Lastly, The most expensive option is the Kenwood line of radios. The D7 and the D700 are nice all in one EXCEPT the GPS packages. I will admit I own a D7 and I really like the thing...for testing purposes. I would'nt bet my life on it, especially the poor battery life with the TNC turned on. But they are nice, netherthe less. I'm not a huge fan because when it comes down to it, I love building and I think APRS is a great area to get into building, from a simple TinyTrak kit to a more advanced HamHUD kit or TNC-X kit. I hold the "Build APRS" saying close to my heart. The HamHUD project was formed on that very principal.

Hope that gives you a good idea of what is out there to try. I made sure to only talk about what I have personally tried/used and I'm sure others with have additional methods and devices to suggest.

Dear Mike,

My setup that has been working flawlessly for over a year:

Yaesu VX2R
Tiny Track SMT
Deluo lite Gps
R/S 9V cigerette lighter plug

all enclosed in a small bright yellow Pelican box.

Antenna is a 1/4 wave Larsen mini-mag

It works so well that I'm thinking about putting together another one
into an even smaller package.

Thanks Jason. =] I think I do come out a bit cheaper than Deluo, at least for APRS use where you don't need the laptop adapter. Plus, at the moment Deluo seems to be out of GPS Lites, so they've been sending me GPS WAAS units instead. Same form factor, different color, better accuracy, same price.

> application. I currently have one in my truck sitting
> on the dash. I used a 7805 regulator with a decent
> heatsink to supply the 5VDC.

I measured the temperature rise on a 7805 once, and it was negligible. The OT1x and TT3+ both use a 7805 bolted down to the board. The PCB itself adds a bit of heatsink capacity.

Jason, do you have a steady supply of these things? I know you can get them cheap on eBay sometimes, but most of us don't have the resources to retune or reprogram Motorola equipment. Since I left my previous job I no longer work 20 feet from a Motorola shop and don't have access to their stuff anymore. I'd love to be able to refer people to a reliable source of APRS-ready commercial rigs. Especially if they came pre-wired for OT/TT3/KPC-3.

> really no better choice than the TNC-X kit from John
> Hansen W2FS http://www.tnc-x.com for full APRS use

I'll second that. The musbtnt is cool, but the TNC-X is cheaper, and John stands behind his work.

TNC: I use a PicoPacket from PacComm (Tampa Fl), with palmone PDA and Garmin GPS, various radios Icom ic-299a/h, old but excellant for APRS, IC-2720, and IC-760 depending on vehicle and trip.
The PicoPacket is a two port TNC with rj-45 connector for RS-232 and Radio and a mini-plug for GPS input, its about the size of a pack of cigarettes.
Software is another problem with this setup in that PocketAprs support no longer available.

Same problem here. I am an avid Palm OS user, thus
avid PocketAPRS user. Now, with dropped support and
no more development, I have been forced to look at
alternates. Including a Pocket PC solution. Most of
the HP/Compaq Ipaq devices look like the way to go.
They do have one with Wifi and Bluetooth built in.
The other attractive option using a device with a CF
slot are the CF serial adapters like this one:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5198616221&rd=1&sspagename=STRK%3AMEWA%3AIT&rd=1
This gives you a ral serial port to work with,
instead of doing USB/Serial tricks.

Looks promising. I just don't want to dump that much
cash into it just yet.

I'd think that this is not an APRS related matter;
it is to be expected that two 2m stations maybe 5m away from each other
will interfere with each other. I don't know how far apart the fone and
APRS frequencies are in the US (if that's where you are - difficult to
know when you have no callsign), but here, it's typically a difference
of less than 1 MHz (APRS 144.800, Fone call 145.500). I have a distance
of 10 meter between my APRS antenna and the one for FM fone, and I can
notice APRS transmissions on the meter of the other station.

<<The standard Battery for the D7 is the PB-39 600mAh at 9.6 volts which provides EXTRA-LONG LIFE Nickel Hydride battery; provides 3 Watt TX output; Batteries America has a PB-39 which is 1100mAh and provides LONG LIFE Nickel Hydride battery; provides 5 Watt TX output at 9.6 volts or>>

Where do you get that information? The D7 manual simply says 9.6V battery, 5W output. And my admittedly cheap wattmeter encourages the fantasy of 5W output from the stock 600mA battery pack, which should be able to supply 5.7W of power when being discharged at the 1C rate. Considering the radio is supposed to be used at a 5% tx cycle (i.e. 1/20th C rate) that's not unreasonable.

Of course, replacing the stock rubber duck with a real 1/4 wave antenna will pretty much double the output regardless of the battery.<G>

Jared

Look at this web site.
http://www.batteriesamerica.com/hamradio.htm
and yes the antenna replacement makes a big difference.

Robin

What are the two frequencies of the two radios in question?

Are they at least a wavelength away from eachother?

Check your grounding on both antennas?

Just some thoughts.

Hi Scott,
Thanks for the reply.
FX are 144.575 for APRS and repeater 147.725 output.
Antenna's are about 3metres apart and sets are about 1.5 metre's apart.
Have checked antenna's etc.
It would appear from other answers that it is a desensing of the voice radio
(which I would agree with).when the APRS Transmits.
I have since cut the APRS power down to 1 Watt and it is not quite so bad.I
think the only way to cure it fully is notch/cavity filters.
Many thanks,
Robin ZL3REW

Richard-
I know of HamAmerica and I know many people like their packs. that still doesn't address my question.

HA can say anything they please, but Kenwood also says the D7 can put out 5W on VHF with the stock battery, and as I've said, my low-end wattmeter confirms that.

Sure, a larger capacity battery pack will put out 5W for a longer time, simply because it will put out higher voltage longer. That doesn't alter the fact that the D7 will put out a full 5W, not the 3W you state, as shipped. Or the fact that they have been shipping with the 9.6v battery pack (higher voltage, lower amperage) for years now.

Personally? When I think the stock pack won't last long enough, I'm using a 2100mA 12.5V battery pack that makes the radio a little taller. And also can use 10xAA's for 15V "instant" recharging.<G>

The stock pack seems to work very nicely for 4+ hours of mixed tx/rx use with all power conservation off, and 6-8 hours or longer with the battery saver in use and tx kept to a minimum. Not a bad start.

<<Do you have any details on where to get this 2100mA 12.5V battery pack?>>

Well, you can buy mine.<G>

Either you buy a 10xAA holder (there's one to be had somewhere on the internet) or you buy a combination that can be epoxied & soldered up to make one. I used two 4xAA flat packs back to back and one 2XAA pack across the end, for a 5xAAx two sided configuration. Place that so the batteries are on their sides, so to speak, and then either velcro the top sided to the bottom of the radio, or make up a slightly longer case so the batteries now fit in the bottom of it. Plug it in via the usual side power socket.

Just remember, you need to use the PB-11 4xAA pack or no pack on the radio itself. if you use the PB-39 (etc) when an external pack is connected, you may constantly be draining some 60mA from the external pack to charge the PB-39.

Cost of AA holders? Under ten bucks. Time? Under an hour. And I've got the option to use any AA cells I can lay hands on, allowing me to have 11 volts with "dead" NiMh cells, 12.5 with good NiCads or NiMh, or 15V with AA's.

The ideal stand-by supply would be to use 10x disposable Energizer lithium AA's, also sold at Rat Shack. They've got over a 5-year storage life and double the power of the best alkaline AA's. As opposed to NiMh cells, which can lose 30% of their charge in one month. (Ouch!)

3092. [APRS] Battery

Greetings

If you really want to build a battery back that puts out the voltage as well as lives a long life
a friend of mine put together a 4 cell battery pack using a BT-11 available on Ebay for $6.50
plus shipping. Inside this battery pack he put 4 Li-Ion AA size 3.6 Volt with 2 Protection IC's
(Never try this with out the protection IC's) wired up produces 14.4 Volt and Last and Lasts.

The batteries and protection IC's can be ordered from BatterySpace.com
the batteries LI-Ion AA size (14500) 3.6 Volt Part # LC-14500 and the IC is listed as One
Protection IC (PCB) for 7.2V 14500 LI-Ion battery pack you will need 2 of these can be had
for about $22.78 plus shipping. You must us a Li-Ion battery charger, which he put on a small
2 pin jack and did I mention it Last and Lasts between charges. This thing would make the
Energizer Bunny go nuts but as all good things I must caution you on.
1. 14,40 Volts exceeds the 13.8 volts recommended by Kenwood. We have had no problems.
2. Always use the IC Protection.
3. Always charge with LI-Ion charger (available at BatterySpace.com).
4. Never short across these cells they will burn up, overheat, or explode. Use IC Protection!

Richard

Have fun but use with caution!

3097. Digi KPC3+ location trouble

Yahoo group: APRS (1998 — 2006)
Date: 2006-01-23 01:46:53 UTC
From: n5vei
Topic: 3097 Message: 3097

Hello all. I am new to the APRS scene and have been setting up my APRS digi. It is a KPC 3+ hooked to an Icom IC-228A. A friend sold me the rig. It is working- repeating and beaconing. The problem that I am having is as follows:
I did a redo of the LT commands for the position and message with my coordinates (which are a 100 miles from the previous ones). But when I goto findu.com, the old coordinates still show the machine 100 miles away. I have double checked my coordinates with my GPS. Here are my setup lines from my files:

```
LT 1 !3227.82NN9005.20W#PHG5130/N5VEI Digi under construction,
Madison, MS N5VEI

Bill,
The problem that I see is in your "LT" text.
the tnc needs to see 6 numbers for the latitude, yours is OK, the
tnc then must see 7 numbers for the longitude, yours is only showing
6! Insert a zero (Ø) in front of the nine (9). It should look like
this for all 4 of your "LT" lines:
LT 1 !3227.82NN09005.20W#PHG.....
^ add the zero (Ø) here in all 4 lines.
Everything else looks OK.
If you have any questions let me know, you can e-mail me
direct at ki0bj@....

3104. RE: [APRS] Paccomm Handi Packet

Yahoo group: APRS (1998 — 2006)
Date: 2006-02-04 15:09:10 UTC
From: Howard K4QB
Topic: 3101 Message: 3104

Hear is pin-out for Paccomm picopacket II for alinco, Icom, Standard, tandy and Yeasu:
6- no connection
5 Rx audio input
4 PTT
3 Ground
2 TX audio
1 r-ptt
Pin one and 2 are connected together a Cap on 2 and a 2.7k resister on 1- this is an internal.
This line is connected internally to the PTT line by a 2.7k resistor to simplify connecting to hand held radios.
The RS-232 serial port connector 1- clear to send 2-receive data , 3 transmit data, 4 requst to send, 5 ground 6 N?C or DCD
Hope this helps
73' Howard K4QB

Ray,

You don't need a data radio to use the MFJ-1270, most any radio will work. I use a GE Phoenix-SX here. They can be
found on Ebay or at hamfests.

Ron - K0QVF

3111. AGWPE and Digi_Ned on Win2K

Yahoo group: APRS (1998 — 2006)
Date: 2006-02-11 14:33:04 UTC
From: n1iic Jason Greene
Topic: 2820 Message: 3111

Greetings. I have AGWPE on my network and I would like to get a Win2K version of Digi_Ned talking with it.
Reading through the documents, Digi_Ned supports AGWPE natively with Linux, but not for Windows as I need.
To get it working with Windows, I believe that I need to configure and re-compile Cygwin, but that is where I get lost.

So, if someone can help me with this, I would appreciate it.

Thanks

Jason n1iic

I am about to use the APRS/CE on an HP Jornada 720 and using an SCS PTC-IIe controller. I looked around to see if there an update to the 1.02 version I have but could not find it. Nor could I find any manual or the APRCE.HTM help file. At present my version is not registered as I am just testing it to se if it works! I wonder if you or anyone else has these.
I also notice that the downloaded maps for Europe from ftp.tapr.org do not match the screen aspect of the Jornada. They are stretched horizontally.

There are several possibilities. A couple of the Kenwood radios, THD7A and TMD700A have APRS built in. You could also use a TNC such as a Kantronics KPC-3+ and then there are the TinyTrack units.

The Kenwoods will allow you to receive messages without a computer, the other options only allow you to send gps data.

>Hi all,
>I read somewhere that you do not need a computer for mobile APRS...

The term "mobile APRS" can be takes two ways: encoding your position,
and decoding your position. If all you want to do is encode, then it's true.
If you want to keep tabs on every one else around you, then no.

>ifthis is so, how does your callsign get on the map?
>
>I've the radio and a GPS....almost there

In a classic setup the GPS feeds a computer, which feeds a
TNC (think of it as a external modem but for radio instead of
a phone line) which feeds the radio.

Then a smart person realized that the TNC was computer based
and the job the computer was doing got moved inside the TNC.

So now the GPS feeds a TNC which feeds the radio.

This leaves the receive side of the TNC unused, as well as the
computer serial port (just enough to hear the data stream from
the GPS). So a device called a TinyTrak was developed that
drops all of the unused parts and leaves you with a transmit-only
device.

<http://www.byonics.com/tinytrak>

Please hook up the speaker audio to the COR circuit
and be a good neighbor.

Then there are the Kenwood radios that have APRS built in.
Just add a GPS to either the THD7A and TMD700A (one is a
handheld the other is a mobile) and you are set.
But you mentioned that you already have a radio.

If the GPS you use accepts NMEA data, and has a display, you will also
be able to decode received position packets and show them as waypoints
on the GPS display. No other computer than the GPS and the TNC/Radio,
i.e. no laptop necessary.

Not all TNC's work directly with a GPS. All the new ones _should_ but if your trying to use an older one it _will_ work with a computer. Your best bet though for mobile use is the "Tracker" option listed below. Only draw back to the "Trackers" is that they are a one way only device. If your trying to recieve messages it won't work.

If the GPS can receive APRS data, it will receive them. Most handheld
Garmin will do so (at least the ones with a serial cable; don't know
about the newer USB things). No special setup needed.
I use a Garmin etrex and a TH-D7, and the etrex will show APRS stations
which are within the display range, and the waypoint list will contain
all stations within the filter range set in the TH-D7. Moving stations
(e.g. other cars) will change position on the display.

My next-generation OpenTracker has 2-way capability. It's still a few months away from production, though. But the prototype plots waypoints just great on NMEA GPS receivers, and for Magellan and Garmin units (not all models) it'll also include altitude, comments, and symbols.

Maybe. There are many versions of the D7; I have the E version from
2001. The menus are all different.

Another option is the OpenTracker (http://www.n1vg.net/opentracker/index.php). About $50 assembled and delivered, but kits and PCB are available too. I just got one a few week ago and love it. Using it with an old Garmin GPS-V and the data port on a Kenwood TM-V7A.

One thing to watch for is that you have the Waypoint option set to 9 Digits NEMA. Otherwise the stations won't show up on the Garmin.

If the GPS can receive APRS data, it will receive them. Most handheld Garmin will do so (at least the ones with a serial cable; don't know about the newer USB things). No special setup needed.
I use a Garmin etrex and a TH-D7, and the etrex will show APRS stations which are within the display range, and the waypoint list will contain all stations within the filter range set in the TH-D7. Moving stations (e.g. other cars) will change position on the display.

Well, they show up in mine, even if my TH-D7 doesn't have a menu option
to set waypoints to 9 digits. So I see e.g. A6HT-9 in stead of LA6HT-9
in the waypoint list in my Garmin and on the display (and when I use the
LIST function of the D7)

From: wolobmp
Topic: 3130 Message: 3130

For sale....MFJ-Data radio model#8621 on freq of 144.39. Good condition, few marks on top cover but front panel is excellent and work very very well! Also offered as a package deal only is a Daiwa model # LA2035R. This amp is 1-5 watts in and 30 watts out; all mode with recv preamp of 15db; really brings the singals in and good solid xmit signal. Have manual for the data radio but no manual for amp, nor any boxes, but will package to ensure safe arrival. Will not split up these items; sold as a pair for $100 shipped. Accept postal money orders and please no trades or COD's. email me at wolobmp at hotmail.com with any questions you might have. Thanks for reading....73 Mike

3131. KPC9612+ Hook up

Yahoo group: APRS (1998 — 2006)
Date: 2006-02-16 05:29:54 UTC
From: urlhit
Topic: 3131 Message: 3131

Is it possible to have a GPS and computer hooked up to a Kantronics KPC9612+ TNC at the same time? I only see two db9 radio ports and a serial db25 connector to connect to a computer. Where do i connect the gps? Looks like i can only have one connect at a time. I would like to have all three connect at the same time radio,computer and gps, is it possible? I looked in the manual but it does not mention anything about all three of them being hooked up only mentions one at a a time either the gps or the computer on the db25 connector. Any help is greatly apreciated.

Fred

From: KC2MMi
Topic: 3131 Message: 3132

Fred, I don't know what your Kantronics will accept, but a GPS is traditionally just another serial device and can be wired up as either DB9 or DB25 serial. (Note, newer USB GPSes are not acceptible here.) The computer serial RS-232 bus is sufficiently identical to the marine NMEA data bus, and you can make a "Y" cable that splits/combines multiple devices on one bus/port for that.

The problem there, is arbitration. If your TNC "hears" both the GPS and the computer talking on the same port at the same time, it may not have the brains to deal with that situation. As the human, you have to figure out if the devices (all of them) are smart enough to play in the same sandbox and share a "Y" cable and single port. For instance, if the GPS is talking (sending data) and the TNC and computer both get that data at the same time, all should be happy. But now, if the TNC and the GPS both "talk" at the same time, what's the computer going to do?

"Daddy he hit me first!"<G>

Sometimes the answer is a "Y" (also called "hydra headed") cable, but you only plug in two devices at any one time. Or, you set up each device to talk/listen as appropriate.

The manual mentions the special APRS-HSP cable on page 101. This is a switch that allows the software connect to the GPS or TNC. The method I use is to connect the GPS to a separate serial port and let the software feed the GPS data to the TNC.

3134. RE: [APRS] KPC9612+ Hook up

Yahoo group: APRS (1998 — 2006)
Date: 2006-02-16 19:24:24 UTC
From: Jim Andrews
Topic: 3131 Message: 3134

Fred,

The 9612+ can only have a single serial device, connected via the DB25, the radio ports are for exactly that.

If you want to put a GPS on it, you have to have a switch between the PC and GPS. You then set the TNC into GPS mode via the PC (IIRC the command is INT GPS) and flick the switch.

The two serial port arrangements with Kantronics kit do get a little confusing, as the KPC-3+ has a second serial port on one of the radio port pins, but alas this hardware arrangement is not possible with the 9612+.

Jim, G1HUL.

From: np2w
Topic: 3136 Message: 3136

Greetings, this is my first post. I have a copy of APRS-CE v1.02. Purchased it in Dayton at Hamvention 2005. Two questions to get started.

What do I do when I have no idea what became of my Registration ID?

What options do I have for maps? I have a DVD full of US TIGER data, but cant find anything about maps for APRS-CE. Can I make them? How? To complicate this issue, I am in the US Virgin Islands.

Thanks for any help.

Bernie McDonnell

Topic: 3137 Message: 3137

I have APRS/CE almost working on my Jornada 720. Apart from maps being horizontally stretched to the 640 pixel screen I have a major problem with controller setup. I have created a TNC config that matches the config that UI-View uses with my SCS PTC-IIe and it seems to run OK. The problem is that although I see the APRS data on the bottom line no stations appear on the map or in the list-stations. Any (reasonable) suggestions welcome. Thanks from Richard (Dick) G4BBH

Dan

I have APRS/CE running on my HP Jornada 720 which has the StrongARM processor. I downloaded from the TAPR site and it ran straight off. They also have separate executables for various processors. My problems seem to be with the controller which is not quite the same as a standard TNC. I have seen it working with a ppc and Kenwood D-7 transceiver with built in packet.

I downloaded some maps from TAPR and a local APRS/CE user here gave me some UK maps. THe only problem I have is that none display correctly on my screen which on the Jornada 720 is 640 pixels wide and it stretches the maps horizontally by at least 2:1. On a normal small display it should be fine.

I was able to set up a packet station with my D7 and a handheld computer. I am using the PC serial to radio cable used for programming the radio. Radio is set in packet mode. I am controlling it with an HP 620LX handheld computer running TeraTerm. This is working flawlessly and I am able to be portable packet in the vehicle through a local digipeater. No buffer problems at all. I also tried this set up with a serial-to-usb adapter and controlled the radio with my notebook and hyperterminal.

3143. Tracker Problems

Yahoo group: APRS (1998 — 2006)
Date: 2006-02-21 20:58:11 UTC
From: Neil Lauritsen
Topic: 3143 Message: 3143

I have been having trouble with my stand alone tracker recently and was looking for some advice. I have a Garmin IV, a KPC-3 Plus Ver 8.3 and a Kenwood 2M radio. For some reason unknown to me I now have to hook up my laptop every time I turn on the KPC-3 Plus and put it back into the GPS mode (INT GPS) I do occasionally use a laptop and UI-View 32 with 7.0 Street Maps. I assume I have some setting incorrectly set probably caused by using a software program and that is the problem. Any suggestions would be welcome. Thanks.

Neil

3144. RE: [APRS] Tracker Problems

From: Ron Cluster
Topic: 3143 Message: 3144

If the KPC3 is really a v8.3, there is a method of connecting the GPS and the Radio to the same DB-9 port on the KPC3. That way you just leave the KPC3 in it's normal mode and you can connect the laptop to the DB-25 port when you want to. I've set up UI-View to initialize the TNC when UI-View starts up, and to put all the setting back when UI-View quits. UI-View gets the GPS info via the TNC so you don't even have to swap cables using this method. Works really slick!

Only downside is you can't run the TNC in KISS mode when using this method but as I don't want my mobile to be a digipeater anyway, that's not really a problem.

I can send you the init files if you need them. The wiring diagram is in the KPC3 manual but I can also send one if you can't find it.

Email me direct if you need more info: rcluster AT rgisp.com

If that's the way you are already running it and the TNC isn't remembering the settings, check the internal memory battery inside the KPC3 (if it has one, I don't recall....). Maybe it needs replaced.

Topic: 3143 Message: 3145

Neil,

I'd suggest hooking your GPS up to the second software driven serial port on the KPC-3.

It's on the DB9 port of the KPC-3.

Read the following for info on this setup:

http://dididahdahdidit.com/plustracker.php

This way you can track and use the TNC on your PC at the same time without having to enter the GPS mode.

Seeya,
Dave

Gordo,

Are you able to plot other stations on your GPS V? Right now, I have 3 DeLuo mouse-type receivers plugged into TinyTrak3's, but also have Garmin III, a III+ and a V I can use, and would like to be able to plot other APRS'ers around me on the screens. Can you display other stations around with the OpenTracker? If I have to get OpenTracker units to display other stations that would be worth it..

Thanks,

TJ

The current OpenTracker is a transmit-only unit, just like the TinyTrak3 (only better. =])
The prototype of the next-generation OpenTracker (just called Tracker2 for now) DOES do waypoint plotting. It'll do generic NMEA, plus Magellan and Garmin proprietary formats. Magellan's pretty uniform, but Garmin has several different versions and I haven't implemented them all yet.

The advantage of using the proprietary waypoint protocols is that you get comment text (if supported by the unit), altitude, possibly temperature for some Garmin units, and an appropriate symbol, within the limits of the symbol set available. Some of the newer Garmin receivers have a custom symbol upload function, so you can get symbols for the vast majority of APRS stations. Older Garmins only have 16 symbols total, and Magellans have a symbol set that doesn't overlap that much with APRS, but it's still a heck of a lot better than having everything show up as a dot or a blue flag.

The firmware is coming along well, but the hardware still needs some serious work before it's ready for production. The one working prototype has a number of wires and at least one resistor tacked on, and the layout needs to be totally reworked. The SMT construction is also way beyond most hobbyists, so it's got to be profesionally assembled. That means more setup time and cost.

I've been toying with the idea of making a through-hole version for testing, even if it was much larger and not very cost effective. Might not be worth the effort, though. And parts like 44-pin SDIP sockets can be hard to find.

3148. Strange Happening in Posting Station on Map

Yahoo group: APRS (1998 — 2006)
Date: 2006-02-22 00:38:21 UTC
From: genied7
Topic: 3148 Message: 3148

Hello All,

Perhaps someone has run into this before.

I am using APRS+SA (latest version) on a long standing 2 meter APRS setup. The station call shown on the APRS+SA setup screen is my usual home station call W3NRG-8.

Recently, in a 24 hour running period, other calls will end up overprinting on the map at my location AND listed beside my Description on the Position2 screen. Somehow the software is mixing up my position information and other data with another call coming through.

I am using "Digi" - perhaps that might be leading to the problem but it never showed up before.

And, yes, the computer I am using is Windows 98SE and not all that fast but it never ran into this problem before in several years of APRS+SA operation.

Yes, I imagine that if I shut down the appication and reload the software the problem might go away but I would be interested to see if anyone else has run into this issue.

Ed Sack

W3NRG
Coronado, CA

So the decoding is done by the radio, as the TT and OT are encode only.. I'm gussing the KPC3+(with APRS engine) can do the decoding too if used with a APRS radio (Kenwoods D7xx-type).. Was just a thot to have stations around displayed on the Garmin III, III+ or V.

The learning curve here is vertical :)

Thanks Scott,

It is possible to display local stations on your GPS when it is fed receive data by a TNC (or the yet-to-be-released OT2). No decoding is done by any radio, except in the case you mention of the TNC-equipped Kenwoods. I'm a newbie here but as I understand it the simple fact is that it is not possible to do any decoding without a TNC, whether it is built-in to your radio (Kenwood D700 and D7), in a standalone unit (KPC3+), or in the OT2.

out of all of this i will summerise what has been said in this thread
1 an aprs tracker doesnot require a computer after it is programmed
2 if you want to decode aprs in the car you need either a computer or one of the kenwood xxd7xxx units
3 with the kenwood d7 units in a menu you can feed back the aprs data into a gps and see it in the gps the ot2 will support it when it comes out
4 only the kenwood xxd7xxx are capable of decoding incoming packets alone because the tnc is built in

With the current TT and OT you're right, they can't decode anything. But the Tracker2 is basically a TNC in itself. It doesn't require an external TNC, D7, or whatever. Just plain audio. And it'll take positions in any APRS format and translate them to the appropriate waypoint format for your GPS receiver.

Say you get a Mic-E burst. The audio is demodulated by an XR-2211 chip (it's basically the RX side of a TNC-2 clone), the T2 checks the validity of the packet, sees that it's Mic-E, and extracts the position, altitude, symbol, and comment. Then, based on what type of GPS you're using, it assembles a waypoint record - say you've got a Garmin GPSmap 60, it'll choose the right format, find the closest symbol match, strip out any characters the GPS display won't show, place the altitude in the waypoint elevation field, and set the position.

The KPC-3+ can plot waypoints on a GPS, but ONLY if they're sent in $GPWPL format, which is very rarely seen on the air. APRSdos will send those, I think.

3156. New Yahoo Group - AvmapG4T - formerly 'geosat4'

Yahoo group: APRS (1998 — 2006)
Date: 2006-02-23 23:38:25 UTC
From: Jim Keck
Topic: 3156 Message: 3156

Hi,

A name change resulted in this New Yahoo Group being formed to provide information and support for this new GPS Navigator. At the NFL Section Convention in Orlando, FL on February 4th, the "Avmap GeoSat 4 Travel" made it debut in North America.

It was decided that a new name (AvMap G4T) would be used to better identify this model within the U.S. and Canada.

You are invited to join this Yahoo Group and learn more about this GPS, provide your suggestions, and become part of its development for use within the Amateur Community and particularily APRS. Don Arnold, W6GPS, is the Owner and Moderator of this Yahoo Group which presently has 52 members. He is also the principal point of contact and the driving force to bring this GPS to North America. His Web Site is at; http://geosat.us

One of the first things you will notice when visiting the Web Site or Yahoo Group is the screenshot of the GPS showing 'full' callsigns of the APRS Amateur Station. A special feature being developed is ITT (Intercept To Target), Software enhancements and updates will be released and available for downloading on the AvMap/IT Website.

On the Web Site and Yahoo Group are photos of the unit and a series of screenshots showing the menus and set up.

Included with the Avmap G4T is a cable to immediately connect it to a Kenwood D700A or D7A(G), along with a Remote Control, a DVD containing the map of the United States pre-loaded onto the 2G Secure Digital Memory Card and additional maps of Canada.

I have been using my G4T for two weeks now and find it to be an outstanding GPS. I encourage you to check it out, especially those HAMS who are using these Kenwood radios. I am sure that it will enhance your experiences while motoring and using APRS.

I understand that the next shipment of these GPS units is about to arrive at your favorite Kenwood Amateur Radio Dealer, ex, HRO. Contact them for availability, pricing, pre-orders, etc.

Good Luck and Have Fun.

73,

Jim Keck, N6JIM

Hi all,

Jack wrote:

>Does anyone still support Pocket APRS? Is there any way to register it?

Short answer: No and no.

Longer explanation: Mike Musick, the developer that wrote pocketAPRS has had to curtail further development and no longer accepts registration requests at all. AFAIK, at his request, TAPR has removed the whole directory which had the application and maps (ftp://ftp.tapr.org/aprssig/palmstuff/palmaprs/).

Those of us fortunate enough to have registered it while it was under active development (and kept those files locally) can still use it. If you can still find these files somewhere (I don't know where they're still publically available), you can still use them ... but you'll have to re-enter all of your information every time you re-start the program. That was the main advantage of registration but, otherwise, it would be fully functional. Good luck. 73

More than likely. Mike told me that the wide combinations of hardware and Palm OS versions was making very hard to keep the program running on these various "platforms". Mostly the way different processors dealt with the program and also the b/w vs. color and screen sizes.

Sorry for the problem. I do not have a radio just an extra manual that I got somewhere. On the schematic it shows pins
numbered 1-5 in small circles and one small circle with no number connected to ground. I incorrectly assumed that is
should have been marked 6. Could it be the metal shell of the connector?

Yes it is the shell. Thanks for looking it up. I eventually found a poor copy of the schematic on the Web and I can see how it is confusing. Problem solved - now off to the iron and solder.

What a clever not-so-little radio with everything you need on the connector!

cheers,

K7TP

Unfortunately this seems to be the new Garmin standard no NEMA. The other problem is lack of RS232 support.

RS-232 or just USB? If it's got Garmin format over RS-232, my new tracker will be out soon and should work with it. Can't do anything about USB yet, though.

From: Alexander N Tubonjic
Topic: 3170 Message: 3170

Hello All,
I am trying to setup a small APRS station to setup at my Fire Department. We have a Davis Weather Monitor 2 weather station setup already and I would like to setup an APRS weather station at the station. I am planning on using an older 2 meter HT as the radio, and would like to use a PDA as the controller. I was just wondering if anyone has used a PDA with a Davis Weather Monitor 2? I would like to get some ideas/suggestions as to how to wire the two together and what software I should run on the PDA. Any suggestions are welcome. Thanks and 73.

If all you want to do is put your weather station on APRS you don't even need a radio. I use a program called Virtual Weather Station. The Internet version. With it and my Oregon Scientific station I send weather information over the Internet to several places, including Findu.com. You can see my weather console (abbreviated version) here http://myweb.cableone.net/rhughes/weather/wx.htm

VWS works fine with the Davis equipment. Of course you do need an Internet connection.

-Might try a WXTrak, you would need radio, and weather station that
hook into the WXTrak (weather trak)it serves as the tnc. These are
called dumb as they only send out weather info, they cannot receive
position reports or messages.
Check out www.byonics.com and go to WXTrak, these are very small kits
you can build or order a pre-built one, programming is very simple.
Make sure that it will support the Davis Weather, about 3 years ago
when I bought mine it would not but Byon was working on it.
My weather is KIØBJ-2
73, Rex, KIØBJ
SouthCentral/SouthEast Montana Gate(HF), Digi, WXTrak, portable APRS.

I recently started this same discussion in the California APRS group...
boiled down to "WIDE1-1,WIDE2-1" being what is recommended, at least for
users in metropolitan areas with high-level digipeaters. YMMV. See if that
works successfully for you in your area.

3176. Weather Display producing too low temperatures

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-05 16:34:08 UTC
From: Jan T.Pharo
Topic: 3176 Message: 3176

Hi;
I am running a LaCrosse WS2300.
Just now, it shows a temperature of -6.8?C.
Weather Display Lite is showing the same temperature on its graph.
The WXNOW.TXT file says: 000/001g002t002r000p000P000b09966h70/fWD
i.e. 2?F, which is -16.7?C. Hence, my UI-View is transmitting that too
low temperature, which in turn is seen by findu and by fellow hams and
others in the near vicinity and further away.
Is there anyone having experience with this incredible difference
between input and output of Weather Display?

(snip)
>Is there anyone having experience with this incredible difference
>between input and output of Weather Display?
Addendum:
With HeavyWeather and UI-Weather, the temperatures in the output text
file are the same as on the WS2300 display. So it seems to be a trouble
with Weather Display, at least the "lite" version.

Followup from myself:
In the WD Forum, they said they know about this error in the free WD
Lite, and that it is fixed in the full-price version. No mentioning that
they'd fix the error in the free version.

Harry,

Yes. Under Setup/Settings expand the Internet item. Double click on filter and then enter the filter value such as
"filter m/1300" without the quotes. Close the setup window and connect to the server.

3185. Mic-E Data Whitesheet / Visual Basic Decoder

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-11 07:36:41 UTC
From: Trevor
Topic: 3185 Message: 3185

Hello all,

I just bought a TM-D700 and am intrested in writing a custom program for a event I do APRS tracking for (They use TinyTracs and KPC-3+'s mainly, and a couple D700's.) I have searched high and low for the whitepaper on it, but can't find anything useful that I can use to build a decoder into my Visual Basic program I have started.

Does anyone know where I can find any of the folowing:

1. Working source code for decoding the Mic-E format in visual basic.
2. The data whitesheet so I can make my own decoding code.
3. Someone that has expreance with coding VB for APRS use (and is willing to help me a little)..

Thanks for any help,

Trevor

Not in VB. I hate VB for this sort of processing, but it shouldn't be all that difficult.

> 2. The data whitesheet so I can make my own decoding code.

ftp://ftp.tapr.org/aprssig/aprsspec/spec/aprs101/APRS101.pdf

> 3. Someone that has expreance with coding VB for APRS use (and is
> willing to help me a little)..

My own Mic-E code is in C (optimized for an 8-bit processor), but I've done a fair amount of VB programming and could probably answer any questions you've got.

In that case, you should probably go straight to the source... the original APRSdos program in Qbasic:

http://web.usna.navy.mil/~bruninga/aprs/Aprs5v.txt

See SUB MIC. Oddly enough, when I look at that code it still brings up images of gorillas with explosive bananas. I hate Qbasic...

From: bino_oetomo
Topic: 3189 Message: 3189

Dear All ...

I read about "anti-Track" that can receive APRS message and display the position at attached GPS unit.

I'm thinking of a "command center".
The CC have tobe able to send a "target" position to the mobile station.

Is there any clue on how-to sending APRS message using only PC and Packet-Modem ?

I meant ... since Anti-Tracker (APRS in common) handled the "call-sign" as "node name" .. i think I need something that enable PC to send APRS msg with dynamic "call-sign".

Bino,
I really don't know much about APRS or exactly how to acomplish what you want, but I have been using a PC sound card packet modem program to listen. (I don't have my licence yetIt also has the ability to transmit, and can be interfaced with other programs. This site might be of some help to begin) Details how to hook the sound card output to your radio are there as well:

Your signal goes to digipeaters located throughout the country. No satellites are involved. APRS is basically a radio system, but Igates at some digipeaters allows a connection with the Internet so that your position can be tracked on a computer. You need to go here to start getting acquainted with APRS. http://web.usna.navy.mil/~bruninga/aprs.html

Stupid question: You do have a valid Amateur Radio License correct?

3194. Using TH-D7 with Dos APRS

From: Buzz
Topic: 3194 Message: 3194

I have looked and don't see the answer to this, but can you use a
Kenwood TH-D7 handheld with Dos APRS and if so, how is it done?

Regards.....Jeffrey, VE3JQR

Stan - N0YXV wrote:
> Stupid question: You do have a valid Amateur Radio License correct?

Yes, if you intend to transmit on an amateur frequency. No, if you're just listening.

(Now, there's some discussion about unattended trackers; check the group archives if you want to see it.)

You'd have to run the D7A without using the built-in APRS functions; you select "Packet" mode on the radio. Connect the PC cable like normal. Then the D7A works as a radio/tnc combo unit, leaving the processing for the external system.

Ok I'm confused lets see if I get this right. You say, correctly, "yes, if you intend to transmit..." and "No, if you're just listening." The comment about "just listening" confused me because the original question was about APRS and trackers and to do that you have to transmit. Then you say "there's some discussion about unattended trackers", are you referring to unlicensed Amateur Radio Operators using a licensed Amateur Radio Operators gear under the licensed Operators call or are you talking about an unlicensed Amateur Radio Operator using an unlicensed Amateur Operators gear? If it's the former, yes your correct there is some discussion both for and against it. If it's the later then the answer would be no because an unlicensed radio operator is never allowed to transmit.

Would be nice if the original poster would comment. I'm wondering what we need to do to help them get a license. Because if they are licensed then all the discussion becomes a mute point.

I might not be understanding the question
correctly.

Certainly a PC + TNC (packet-modem), plus
of course a radio, can send APRS messages.
Any of the APRS software is capable of that.

And I'm not sure what you might mean, Bino,
about "target" position. Do you mean the
command center sends to the mobile(s) the
location of a third and separate location?
APRS software can send OBJECTS to the other
units. Those OBJECTS can be anywhere in the
world.

Am I anywhere near what you're asking?

From: Trevor Raty
Topic: 3200 Message: 3200

FYI-

Myself and some others from the Bay Area of California have started up a yahoo group dedicated to the expansion and maintenance of the current packet radio network in northern California. This includes - APRS, 1200, 9600, D-Star, 802.11, and any other forms of packet.

This is more of a technical group, but if you are interested in non-APRS packet, and your in northern California, you may want to join up.

OK. This is the original poster (Newbie).

I'll set your mind at ease. As I said in the original post, I am getting the APRS parts together - but its not ready yet nor transmitting. I plan to sit the exam in a couple of weeks and don't see what help is needed in that respect. I asked a technical question not expecting this inquisition about licensing. Most of the readily available APRS info is about how to setup the station but little is said what happens to the signal when it leaves the trasmitter. I saw a lot about APRS satelites in some links - so wasn't sure where the signal went. I am technically curious by nature.

I am also a pilot and am glad to help people who ask questions without worrying whether they are licensed or not. APRS seems useful for flight tracking and I am expecting that my APRS and my ham license will crystalize together in about two weeks.

Now lets stop all this worrying and try to help each other.

3204. Anyone using Wi-Sys

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-17 18:12:00 UTC
From: g4bbh@winlink.org
Topic: 3204 Message: 3204

I have just obtained a Wi-Sys 7110 APRS box. This seems very nice and the built-in GPSA works well. All very versatile and seems to work well.

It can be a pain to use a laptop to make any minor changes to the setup. I have a palmtop with dumb terminal and can connect to the Wi-Sys and run the 'cal' commands. Now I'm wondering if there are any other simple basic commands for use on the command line. I know there is a firmware upgrade which provides TNC type commands but have been warned that this upgrade can cause other problems.

Also has anyone tried outputting the data to APRS/CE for display?

Anyone know about this?
Richard (Dick) G4BBH

Hello Paul, Let me see if I can shed some light on your question.

The 3 primary parts you will need is:
1. GPS
2. Some sort of TNC {More later}
3. A Radio

First off you will need a GPS that supports NEMA output from the device, I personally have been using the Garmin Etrex in my vehicles. {simple, cheep}

The GPS is connected to a TNC {Terminal Node Controller} of some sort, There are many out there to chose from. TNC's vary from Tinytraks {dumb TNC} to the High performance Kantronics KPC3+.

The final item is a radio, the most popular for this forum is a 2 meter amateur radio, it can be a 5 watt HT to a 50 Watt mobile unit.

The nema string is converted through the TNC to a digital format and then transmitted, very basic concept.

The signal from the radio is transmitted to "ground stations" called Digipeters, again a TNC takes the data and retransmits it to a larger area. The "digi's" can be located at homes, mountain tops, towers, buildings etc...

Of course the signal can go from station A to station B without any need for a digi. but the range becomes limited.

The 2M freq is 144.390MHZ and all stations are transmitting and receiving on this freq. {aka Simplex}

There are stations that are connected to the internet that will "gate" your data to a server permitting your location to be displayed on the internet. www.findu.com is the most popular.

Yes there are satellite digi's up there and the ISS has one on board, normally they are working on other freq.'s then the national APRS freq. www.amsat.org for more information.

This is the basic operation of an APRS station, there are many variables to this but they all have a common goal, some radios even come with a TNC built in.

There are many pilots out there that run APRS on there craft so I would think that you could find someone in your circle of associates that can help you set up your craft.

You did not state your location but there are many Ham clubs throughout the country and world that would be more then happy to lend you a helping hand, a good place to look in your area for a club is via www.arrl.org website. {or a Google search for your area will work too}

Good luck on getting your ham license, I hope this helped you understand a little more about what the basic functionality of APRS is and does, if you have any more questions please feel free to ask on or off list..

OK. Here is another question and hope some of you guys can answer it without bias. I am getting the parts together for an APRS tracking station to track my aircraft movements when in air. I am also planning to write the HAM test in two weeks but that is incidental to my question below.

I just went to the FCC page regarding aircraft radio licensing permits.
http://wireless.fcc.gov/aviation/fctsht4.html
Also check
http://www.fcc.gov/Bureaus/Wireless/Orders/1996/fcc96421.txt for regulation details.
It says there that I do not need an individual amateur license to operate 2M radios and the multitude of other aircraft related radios on board. The call sign simply is my aircraft number. I would be using the APRS only for aircraft operation. FCC makes provision for aircraft owners to get their license by filling in form 605? Most aircraft owners don't bother filing the form. But an FCC license may be needed if flying outside of US. Be objective with your answer....

I too have the 7110 and I found that the learning curve was fairly steep, but once set up it does work well.

However, as I don't have a Palm and APRS/CE I can't help you there. But, you could try to contact the Wi-Sys people at 613-254-7386

Amateur radio falls under part 97 of the FCC rules, you must have a Amateur radio license to operate in the amateur radio band allocations.

The stipulations you have read are NOT for amateur radio, this is for marine and aircraft radios.

Marine radios run in the 156 MHz freq range, ham radio 2M is 144 - 148 MHz.

Aircraft radio Runs in the 122 MHz range.

This is still within the VHF band but separate rules are applied.
The rules you are referring to are part 80 and 87 not part 97.

The arrl website has the complete rules for part 97, you can also find them at www.fcc.gov

I just went to the FCC page regarding aircraft radio licensing permits.
http://wireless.fcc.gov/aviation/fctsht4.html
Also check
http://www.fcc.gov/Bureaus/Wireless/Orders/1996/fcc96421.txt for regulation details.
It says there that I do not need an individual amateur license to operate 2M radios and the multitude of other aircraft related radios on board. The call sign simply is my aircraft number. I would be using the APRS only for aircraft operation. FCC makes provision for aircraft owners to get their license by filling in form 605? Most aircraft owners don't bother filing the form. But an FCC license may be needed if flying outside of US. Be objective with your answer....

Not qite the story. There are various frequencies for different aircraft radio equipment. The VOR runs at lower freqency and some elts are near the 300MHZ range. The FCC does not specify aircraft radio frequencies.... Show me... The FCC page says VHF radios for aircraft - plus other equipment. It does not say 122MHZ "range". Aircraft transponders run near 1GHZ range.

3211. no new APRS products?

I was really excited and quite active in APRS about 5 years ago. There were all kinds of neat products like the TinyTrak, the Kenwood D-700A and TH-D7A, and software like UI-View. I've been away from APRS for a few years, and I don't see any new products. Sure, the TinyTrak has been updated, but after all this time, why aren't there any cool new APRS products and applications? Is APRS going stale?

3212. APRSPoint 3.0 is available

```
A new version is available. What's new in 3.0,

1. Implemented APRS server filter setting,
2. Enabled auto connect for TCP connection,
3. Customization of track line width and style,
4. Numerous fixes and enhancements,

Please visit http://www.aprspoint.com for details. Thanks.
```

As long as the equipment and software are doing good service for the
task*, why new products?
(well, UI-View has been developed until spring 2004; recent and final
version is 2.03)

I'm looking for a good recommendation for a GPS that I can use with APRS. I'd also like it to have or have the option of an external antenna for GPS to mount on the external side of the car so the GPS can be safely mounted in the trunk. I'd also like to run it off of 12v dc. Any suggestions?

Thanks and 73's

I got a retransmitting GPS antenna half a year ago;
a magnetic "mouse" device outside, a lead to the inside of the car with
some electronics, a power cable for the 12V power (the outlet originally
thought for smokers) and an antenna to be mounted inside, passing
signals on to the GPS (not more than approx. 50 cm from the GPS or the
GPSes)
Now, where do I find the dealer... (archive search going on...) - aha!!:

Ditto for the Deluo WAAS. It's got a magnet built in, and I've got one stuck to a lock on the rear deck, with the cable running behind the seat and into the trunk. Never had a problem with it staying locked, even though all of the rear windows are tinted - I know the film can interfere with RF.

3219. Group content re-transmitted outside Yahoo!?

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-20 06:41:22 UTC
From: kc9cbx
Topic: 3219 Message: 3219

Occasionally, I will do a Google search on my own email address just to ensure that it's not posted on any websites that are easily available to the spam bots that collect emails. Recently I discovered a website that re-transmits the content of this group and makes it readily available to anyone, complete with user full names and email addresses.

According to the Yahoo terms of service it is prohibited to "collect or store personal data about other users".

While this website might appear as an interesting experiment, I certainly didn't give anyone a permission to publish my name and email....

List owners: is there anything that can be done about this? This is not only a violation of yahoo terms, it is also a violation of everyone's privacy.

Website in question: http://on0ar.dyndns.org:7373/cmd?cmd=READ+APRS+3391

Paul, it sounds like you're going to do fine when you take your ham test...

After reading the FCC page you referenced, I can see how you would get the impression that you did, but bear in mind that part 87 (47 CFR 87) only applies to the aviation frequencies. The point of the article is that you do not need a separate aviation station license of each radio on a plane, nor for each plane in a fleet, nor for a handheld aircraft radio. It does not give blanket authorization to operate any radio from a plane, regardless of frequency.

That being said, lets talk about some issues of operating APRS from an aircraft. A Tracker in an aircraft need to be setup differently from one in a car.

There are several hams running airborne APRS who are active on the TAPR aprs special interest group. I would strongly recommend that you join that group and post a note asking for recommendations about equipment setups and path settings.

Welcome to ham radio, and I look forward to seeing your plane on my APRS screen.

Paul, W2PI

Aircraft radios must meet specifications listed under TSO C37b to be included as part of the Aircraft Radio Station License.

Radios made for Amateur Radio Service do not meet this spec.

The "Restricted Radiotelephone Operators Permit" only allows for the operation of those radios installed as part of the "Ships Radio Station". Not Amateur Radio Stations.

Another side to this debut is "commercial radios" installed in aircraft which are capabable of transmitting on the amateur bands (primarily HF radios) is not allowed, because those radios were not type approved for use on the amateur radio service frequencies.

All radio equipment installed in certified aircraft must conform to TSO C-37b.
Radios used in the amateur service do not meet this type certification.

All aircraft with radios installed, that transmit a signal must have a Radio Station Lisense. Eg: VHF Comm. DME, ELT, Transponder etc.

Radio operators are licensed with a Restricted Radiotelephone Operator Permit that only allow the operation of radios licensed by the Aircraft Radio Station Lisense.

In another argument, comercial radios installed in aircraft(typically HF) that are capable of transmitting on the amateur service bands are not "legal" to be used on amateur service due to type certification. I don't know how the old ARC-5s fit in here.

Have you "opted out" by going to Yahoo's Privacy Policy and scrolling 2/3 down the page and clicking on "web beacon" and then scrolling down that page to "opt out?" Be careful at that page to not opt back in. The page is a little tricky. This process must be done on each computer you use and ALSO on each browser if you use more than one. I suspect that if you delete cookies from your machine you have to go through the process again each time you sign in to Yahoo.

Well the first thing you would want to know is what version does the KPC3 have? Is it a KPC3 or a KPC3+? You can talk to the KPC with standard terminal software like Hyperterm (in Windows). I think there is a couple of small how-to's on the Kantronics web site http://www.kantronics.com/. Once you can talk to the TNC you can get the version number from it. I believe the version number that you would need for a stand alone installation would be 8.2. By stand alone I mean without a computer attached to the TNC. I actually have a similar setup in my car that has the GPS connected to the serial input on the KCP3. Mine is a KPC3 not the KPC3+. I _think_ all KPC3+'s can do GPS input.

If you have the correct software (firmware) version you connect the GPS to the serial input and then the HTX202 to the TNC and that's all you have to do for the hardware side. The setup side is a little bit trickier..

Web Sites:

http://home.wi.rr.com/n9uur/kpc3tracker.html = KPC3+ as a tracker configuration

http://aprsearch.net/ = APRS Search Engine

http://www.kc5goi.net/aprs/kpc3+_setup.htm = Using A Second Serial Port in the KPC

http://home.wi.rr.com/n9uur/kantronics.html = KPC3 Plus APRS & GPS Setup

http://gpss.tripoduk.com/radio.htm = GPS and Radio Communications (General Info)

http://www.cookiearrangements.com/AmateurRadio/hm-aprs.htm = Harford Marathon APRS Group's Setup for KPC3

Haven't really found a complete site (that's doesn't have a broken URL) that explains it all. If you have to upgrade the firmware in your KPC3 you might want to look into getting a TinyTracker. I only say that because the cost of a new TinyTracker is about the same cost [unless you know somebody... ;-)] as what Kantronics wants for firmware upgrades when firmware upgrades are available.

http://www.byonics.com/tinytrak/ = TinyTracker

3226. Path and digis

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-20 18:33:52 UTC
From: Charles Crizer
Topic: 3226 Message: 3226

Hi everyone.

I traveling a bit and I changed my path statement from the old RELAY etc to the newer WIDEn-n format. I'm using 2 path statements that transmit every 5 and 6 minutes. They are:

WIDE1-1, WIDE2-2

10LINK3-3 ('m currently near Interstate 10)

Should I just remove the ##LINK path? I can't see where it is really needed. (I'm told it isn't being used down here anyway but that is a different matter.)

I'm thinking that if I'm in an area that is so remote that a WIDE3-3 is needed, what are the chances that there a DIGI that is hearing and repeating the call? It would just clog things once I came into a populated area with DIGIs. Or should I have a WIDE3-3 put place at a longer interval?

I'll also be doing hurricane response this year. What is a good path to use then? I'll be all over the affected area, sometimes in very remote areas.

Any advice on my timers?

KF4MNE-9 on findu.

<snip>

Not true. The aircraft's radios may be used in amateur service provided the radios are not modified to void their certification and are used by an amateur with a license appropriate for the power and frequencies used. As you have said this basically means the HF radios as the others do not overlap ham bands. You won't see too many Narco's or King Air's on 144.39 (to keep this on topic).

Probably a mute point unless one is flying internationally or spending a lot of time over the ocean. On the other hand, a lot of larger military planes use HF domestically and their radios work really well on the ham bands. (Wink, wink, he said knowingly.)

A ham can use just about any kind of transmitter on the air in the US provided it meets power and basic spectral purity requirements.

The Federalies do get testy about rigs that can operate with illegal power on 11 meters or listen to cell phones.

The website I'm referring to is NOT affiliated with Yahoo, so yahoo beacon has nothing to do with it, it is a third party, private individual that is posting content of all of the treads on the group on the publicly accessible website including names and emails.

This group is available to anyone who wants to join, and you have to be a human to log in an view the content. This gives everyone a reasonable protection from automated programs that are scanning websites for email addresses. If your email is just sitting out there on any random website it WILL be harvested by a spambot and your inbox will be bombarded with spam email messages.

Again, website in question:

> ...

Any FAA TSO refers to type certificated aircraft equipment quality manufacturing standards. For example experimental homebuilts do not meet type certification - just certain self run test standards. I fly an experimental and could build my own aircraft radio. But that would be an extreme effort. Its bad enough to build the aircraft from main parts.

Hey, some of us are doing our best. =] Here's the test version of my new tracker/digi/tnc board:

http://n1vg.net/opentracker/images/ot2m.jpg

This wasn't originally going to be a through-hole kit - the first prototype is all surface mount - but I decided for testing purposes that it'd be nice to have an easy-to-build version. It's still in development, but it already works as a KISS TNC, does WIDEn-n digipeating with preemption and hop limits, and it outputs all incoming positions as waypoints to NMEA, Garmin, or Magellan GPS receivers. For Garmin (not all models yet) and Magellan (serial interface ones anyway) it'll set the waypoint symbol appropriately, and include comment text and such.

My next generation's going to have an ARM7 processor, DSP-based with 9600 baud support. So far none of the comm stuff is done on that project, but it does USB, and can access 256 megs or more of storage on an SD card. Not sure what a TNC is going to do with that much memory, but hey, it's cheap.

Also working on versions of both those boards that'll drop into an Alinco DR-135T in place of the OEM TNC board. Might not compete with the D700 for features, but it'll be a fraction of the price.

I'll be getting two when they come out. One for the laptop setup and one to add to the HamHud. (hey theres another NEW product!) I imagine I'll get the HUD soldered up right about the time you go to kit on this.

Put me down for two.

I do. 256 Megs of store and forward memory to support Airmail/Telpac in a
SD card would be right on time! Attached files are limited to 100k.

As far as the drop in board forthe Alinco, look at all the units out there
people have bought without the TNC? I see them at hamfests all the time.
Like aftermarket PL boards you have a great market there!
```

Yeah, the TNC runs about $100, and while it'll do 9600 baud (more or less), it's lousy for APRS. My biggest problem is finding someone to make the little jumper assemblies I need to connect my board to the 1.5mm pitch connector in the radio. I might have that figured out now - I've got some parts coming in this week and I'll find out.

The HamHUD doesn't do KISS yet I don't think, but it was being worked on.
The T2 does have a KPC-3 style output mode though, so with a little more
work it could be made to talk to a HUD.

3238. Re: Newbie Question

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-21 04:33:43 UTC
From: G. Hopper
Topic: 2795 Message: 3238

While Al Wolfe covered it, I'll put a finer point on the mis-statement about "type acceptance" in the amateur service.

No "type acceptance" or type approval is required for any radio used within the amateur service. I'm not sure that type approval is even available for amateur radios. Two common occurances within the ham community bear out the common sense of this.

First, hams frequently (and as a part of our tradition) build our own gear. The cost of obtaining a type acceptance (were one required for operation in the amateur service) would be so prohibitive, no one would ever build their own gear. Second, hams who are cops, firefighters, forest service employees, radio techs, etc. often have type accepted commerical gear that has been retuned or programmed to cover both the commerical band they are authorized to use, and the appropriate amateur band. These radios are perfectly proper to use in both services. The key in example number two is to not physically modify the commerical radio such that it "looses" its type acceptance of the commerial use.

--- In APRS@yahoogroups.com, "Mike Miller" <aa8vtr@...> wrote:

> Another side to this debut is "commercial radios" installed in aircraft

> radios) is not allowed, because those radios were not type approved for
> use on the amateur radio service frequencies.
>
> Bregards, Mike N8ZUV

In short, you can use commerical gear in the amateur bands as long as you observe the rules about emissions, and you can't use amateur gear in the commerical service(es) and expect to get off scot free if you get caught.

No type acceptance worries within the amateur service.

They do, as I understand it, require FCC certification though. Not a problem for homebrewers, as long as you don't make more than a certain number, and only for your own use.

From: Charles Crizer
Topic: 3240 Message: 3240

What is the protocol for creating an Emergency Beacon? If I needed to create one using my KPC, is it as simple as modifying the BTEXT? If so, what is the exact protocol?

I done a number of Google searches and checked out the usual suspects but I could find anything that answers my question.

An example:

K1MAD-2>STUTXY,RELAY,WIDE1-1,qAR,N1VG-1:`07slrF>/"4Q}

Ugly, huh? =] Part of the position is carried in the destination call ('STUTXY' in this case). There are some bits in there that set several pre-defined messages (emergency, in service, etc). Not easy to set up by hand. Also, there's one unprintable character that gets used sometimes and causes all sorts of problems.

They do, as I understand it, require FCC certification though. Not a problem for homebrewers, as long as you don't make more than a certain number, and only for your own use.

Scott
N1VG

The term, "Type Acceptance" has been replaced with, "Certification" in the FCC rules, but you will still find Type Acceptance in some documents. Only external amplifiers require Certification in the amateur service. See 47CFR97.315 & 47CFR97.317.

From: Charles Crizer
Topic: 3226 Message: 3245

Thanks. I checked it out and found the new reference. The one I was using was old.

I've simplified and my path is now just WIDE2-2 which transmits every 5 minutes. I beacon every 10.

There is no need for any other PATH statements. If WIDE2-2 doesn't get me into FINDU then I doubt anything higher will. After all if I'm that remote, what's the chance that there is a digi repeating my signal? A WIDE3-3 or higher will just cause congestion in a metro area.

Subject: [APRS] Path and digis

Hi everyone.

I traveling a bit and I changed my path statement from the old RELAY etc to the newer WIDEn-n format. I'm using 2 path statements that transmit every 5 and 6 minutes. They are:

WIDE1-1, WIDE2-2

10LINK3-3 ('m currently near Interstate 10)

Should I just remove the ##LINK path? I can't see where it is really needed. (I'm told it isn't being used down here anyway but that is a different matter.)

I'm thinking that if I'm in an area that is so remote that a WIDE3-3 is needed, what are the chances that there a DIGI that is hearing and repeating the call? It would just clog things once I came into a populated area with DIGIs. Or should I have a WIDE3-3 put place at a longer interval?

I'll also be doing hurricane response this year. What is a good path to use then? I'll be all over the affected area, sometimes in very remote areas.

Moderator here:

While I hate getting the Spam also, there's nothing really hidden by this list. Here are the settings in Yahoo as they've been since Day-1:

Membership Type and Welcome Message
Membership Type: Open (anyone can join)
Email Address Display: Members of your group may not hide their email address.
You can view their email address on member listings.
Their address will be displayed on the messages they post.

A lot of good technical information is passed here and I would expect someone to use it elsewhere. Hopefully with credit to the source. I've found my posts in many lists, including the TAPR APRS list, posted elsewhere without my permission but with credit, and I'm flattered. And I think and hope many postings have lead to productive conversations using direct e-mail.

Most people suggest the use of a disposable address while using public mailing lists. If a list member here can't do something like that, they you may need to reconsider your participation here.

Again, Spam is out of control. Until a few of the major Spammers show up dead somewhere, not much is going to happen. Our government is under the false impression that they can cure the problem with more laws, but the reality of the Internet is that the US doesn't control it. As I often say, Organized Crime is better than disorganized crime. If something like this had happened in the early part of the 1900's and affected big business as it does now, it wouldn't have been a problem for very long.

speaking of new software google makes a great aprs program just add a translator

ok so it primary function isnt aprs but with the aprskml<https://aprskml.dev.java.net/>program it is great i can do aprs and geocaching and get driving directions in one program ;)

hi

i have running a dogi on a KPC3 version 8.2

i want to stop it remotely,how do i do it?

there should be a command i would send it so it would put it in a

sleep mode if you like

and

can i restart it later ??

thanks for the informations

gervais ve2ckn

Hi, is there any tricks to downloading this program if you know? I
joined up and logged in and unable to download it.

Thanks,
Dan
